AWS Certified Machine Learning Specialty Course

MLS-C01

Data Engineering

Moving, Storing and Processing data in AWS

AWS S3 Overview

- Amazon S3 allows people to store objects (files) in “buckets” (directories)
- Buckets must have a **globally unique name**
- Objects (files) have a Key. The key is the **FULL** path:
 - <my_bucket>/**my_file.txt**
 - <my_bucket>/**my_folder1/another_folder/my_file.txt**
- This will be interesting when we look at **partitioning**
- Max object size is 5TB
- Object Tags (key / value pair – up to 10) – useful for security / lifecycle

AWS S3 for Machine Learning

- Backbone for many AWS ML services (example: SageMaker)
- Create a “Data Lake”
 - Infinite size, no provisioning
 - 99.99999999% durability
 - Decoupling of storage (S3) to compute (EC2, Amazon Athena, Amazon Redshift Spectrum, Amazon Rekognition, and AWS Glue)
- Centralized Architecture
- Object storage => supports any file format
- Common formats for ML: CSV, JSON, Parquet, ORC, Avro, Protobuf

AWS S3 Data Partitioning

- Pattern for speeding up range queries (ex: AWS Athena)
- By Date: `s3://bucket/my-data-set/year/month/day/hour/data_00.csv`
- By Product: `s3://bucket/my-data-set/product-id/data_32.csv`
- You can define whatever partitioning strategy you like!
- Data partitioning will be handled by some tools we use (e.g. AWS Glue)

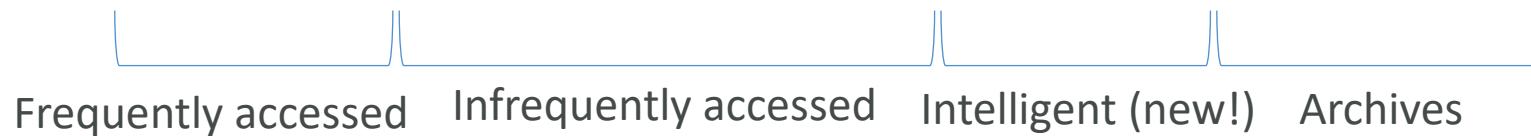

S3 Storage Tiers

- Amazon S3 Standard - General Purpose
- Amazon S3 Standard-Infrequent Access (IA)
- Amazon S3 One Zone-Infrequent Access
- Amazon S3 Intelligent Tiering
- Amazon Glacier

S3 Storage Tiers Comparison

	Standard	Standard - Infrequent Access	One - Infrequent Access	S3 Intelligent-Tiering	Glacier
Durability	99.99999999%	99.99999999%	99.99999999%	99.99999999%	99.99999999%
Availability	99.99%	99.9%	99.5%	99.90%	NA
AZ	≥3	≥3	1	≥3	≥3
Concurrent facility fault tolerance	2	2	0	1	1

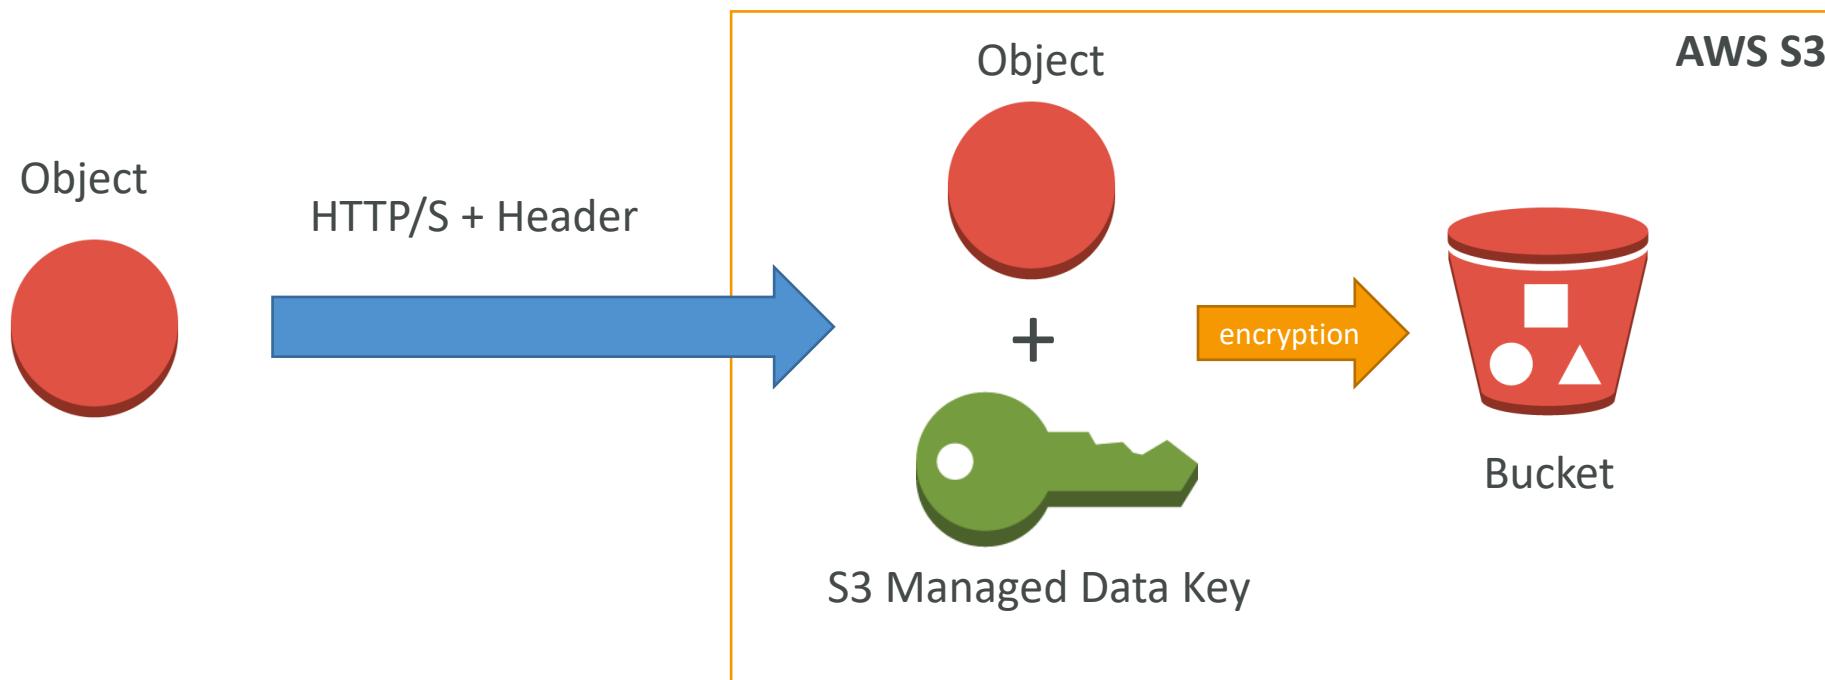

S3 Lifecycle Rules

- Set of rules to move data between different tiers, to save storage cost
- **Example: General Purpose => Infrequent Access => Glacier**
- **Transition actions:** objects are transitioned to another storage class.
 - Move objects to Standard IA class 60 days after creation
 - And move to **Glacier** for archiving after 6 months
- **Expiration actions:** S3 deletes expired objects on our behalf
 - Access log files can be set to delete after a specified period of time

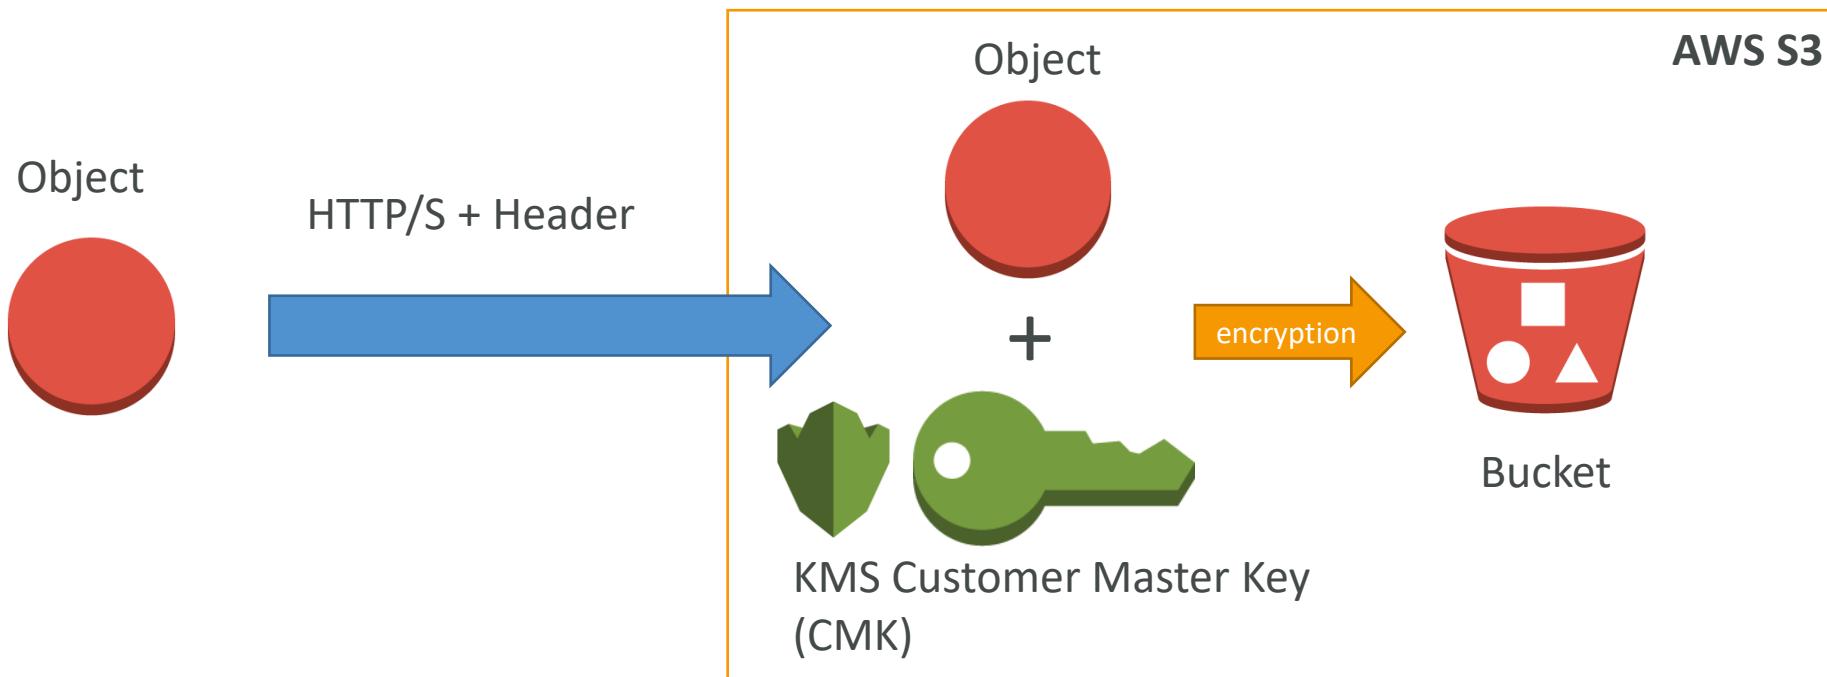

S3 Encryption for Objects

- There are 4 methods of encrypting objects in S3
- **SSE-S3:** encrypts S3 objects using keys handled & managed by AWS
- **SSE-KMS:** use AWS Key Management Service to manage encryption keys
 - Additional security (user must have access to KMS key)
 - Audit trail for KMS key usage
- **SSE-C:** when you want to manage your own encryption keys
- **Client Side Encryption**
- **From an ML perspective, SSE-S3 and SSE-KMS will be most likely used**

SSE-S3

SSE-KMS

S3 Security

- User based
 - IAM policies - which API calls should be allowed for a specific user
- Resource Based
 - **Bucket Policies** - bucket wide rules from the S3 console - allows cross account
 - Object Access Control List (ACL) – finer grain
 - Bucket Access Control List (ACL) – less common

S3 Bucket Policies

- JSON based policies
 - Resources: buckets and objects
 - Actions: Set of API to Allow or Deny
 - Effect: Allow / Deny
 - Principal: The account or user to apply the policy to
- Use S3 bucket for policy to:
 - Grant public access to the bucket
 - Force objects to be encrypted at upload
 - Grant access to another account (Cross Account)

S3 Default Encryption vs Bucket Policies

- The old way to enable default encryption was to use a bucket policy and refuse any HTTP command without the proper headers:

```
{  
  "Version": "2012-10-17",  
  "Id": "PutObjPolicy",  
  "Statement": [  
    {  
      "Sid": "DenyIncorrectEncryptionHeader",  
      "Effect": "Deny",  
      "Principal": "*",  
      "Action": "s3:PutObject",  
      "Resource": "arn:aws:s3:::<bucket_name>/*",  
      "Condition": {  
        "StringNotEquals": {  
          "s3:x-amz-server-side-encryption": "AES256"  
        }  
      }  
    }  
  ].
```

```
{  
  "Sid": "DenyUnEncryptedObjectUploads",  
  "Effect": "Deny",  
  "Principal": "*",  
  "Action": "s3:PutObject",  
  "Resource": "arn:aws:s3:::<bucket_name>/*",  
  "Condition": {  
    "Null": {  
      "s3:x-amz-server-side-encryption": true  
    }  
  }  
}
```

- The new way is to use the “default encryption” option in S3
- Note: Bucket Policies are evaluated before “default encryption”

S3 Security - Other

- **Networking - VPC Endpoint Gateway:**
 - Allow traffic to stay within your VPC (instead of going through public web)
 - Make sure your private services (AWS SageMaker) can access S3
 - **Very important for AWS ML Exam**
- Logging and Audit:
 - S3 access logs can be stored in other S3 bucket
 - API calls can be logged in AWS CloudTrail
- Tagged Based (combined with IAM policies and bucket policies)
 - Example: Add tag Classification=PHI to your objects

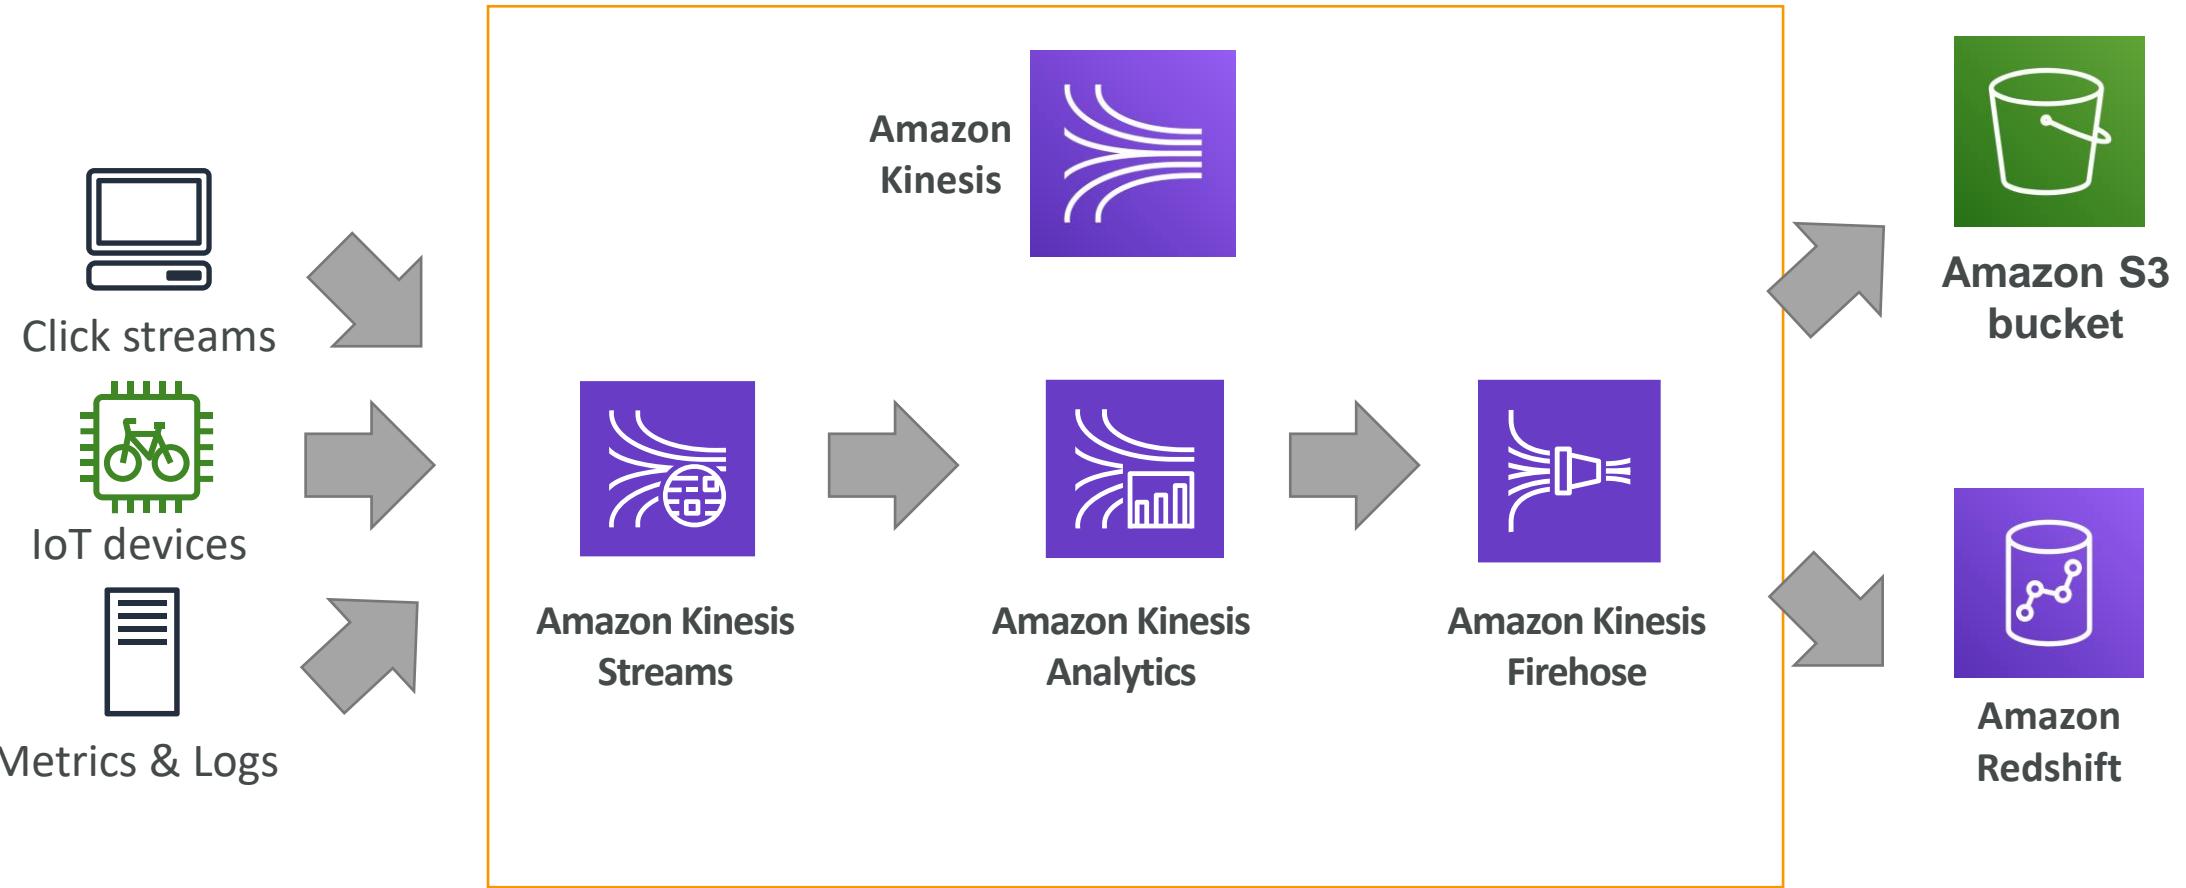

AWS Kinesis Overview

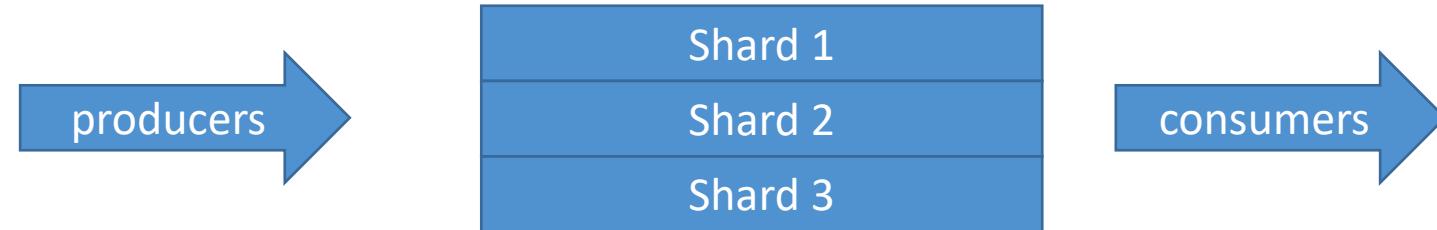

- **Kinesis** is a managed alternative to Apache Kafka
 - Great for application logs, metrics, IoT, clickstreams
 - Great for “real-time” big data
 - Great for streaming processing frameworks (Spark, NiFi, etc...)
 - Data is automatically replicated synchronously to 3 AZ
-
- **Kinesis Streams:** low latency streaming ingest at scale
 - **Kinesis Analytics:** perform real-time analytics on streams using SQL
 - **Kinesis Firehose:** load streams into S3, Redshift, ElasticSearch & Splunk
 - **Kinesis Video Streams:** meant for streaming video in real-time

Kinesis

Kinesis Streams Overview

- Streams are divided in ordered Shards / Partitions

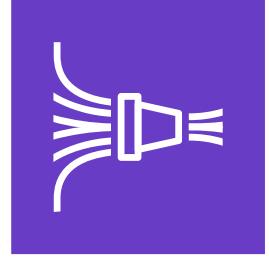

- Shards have to be provisioned in advance (capacity planning)**
- Data retention is 24 hours by default, can go up to 7 days
- Ability to reprocess / replay data
- Multiple applications can consume the same stream
- Once data is inserted in Kinesis, it can't be deleted (immutability)
- Records can be up to 1MB in size

Kinesis Data Streams Limits to know

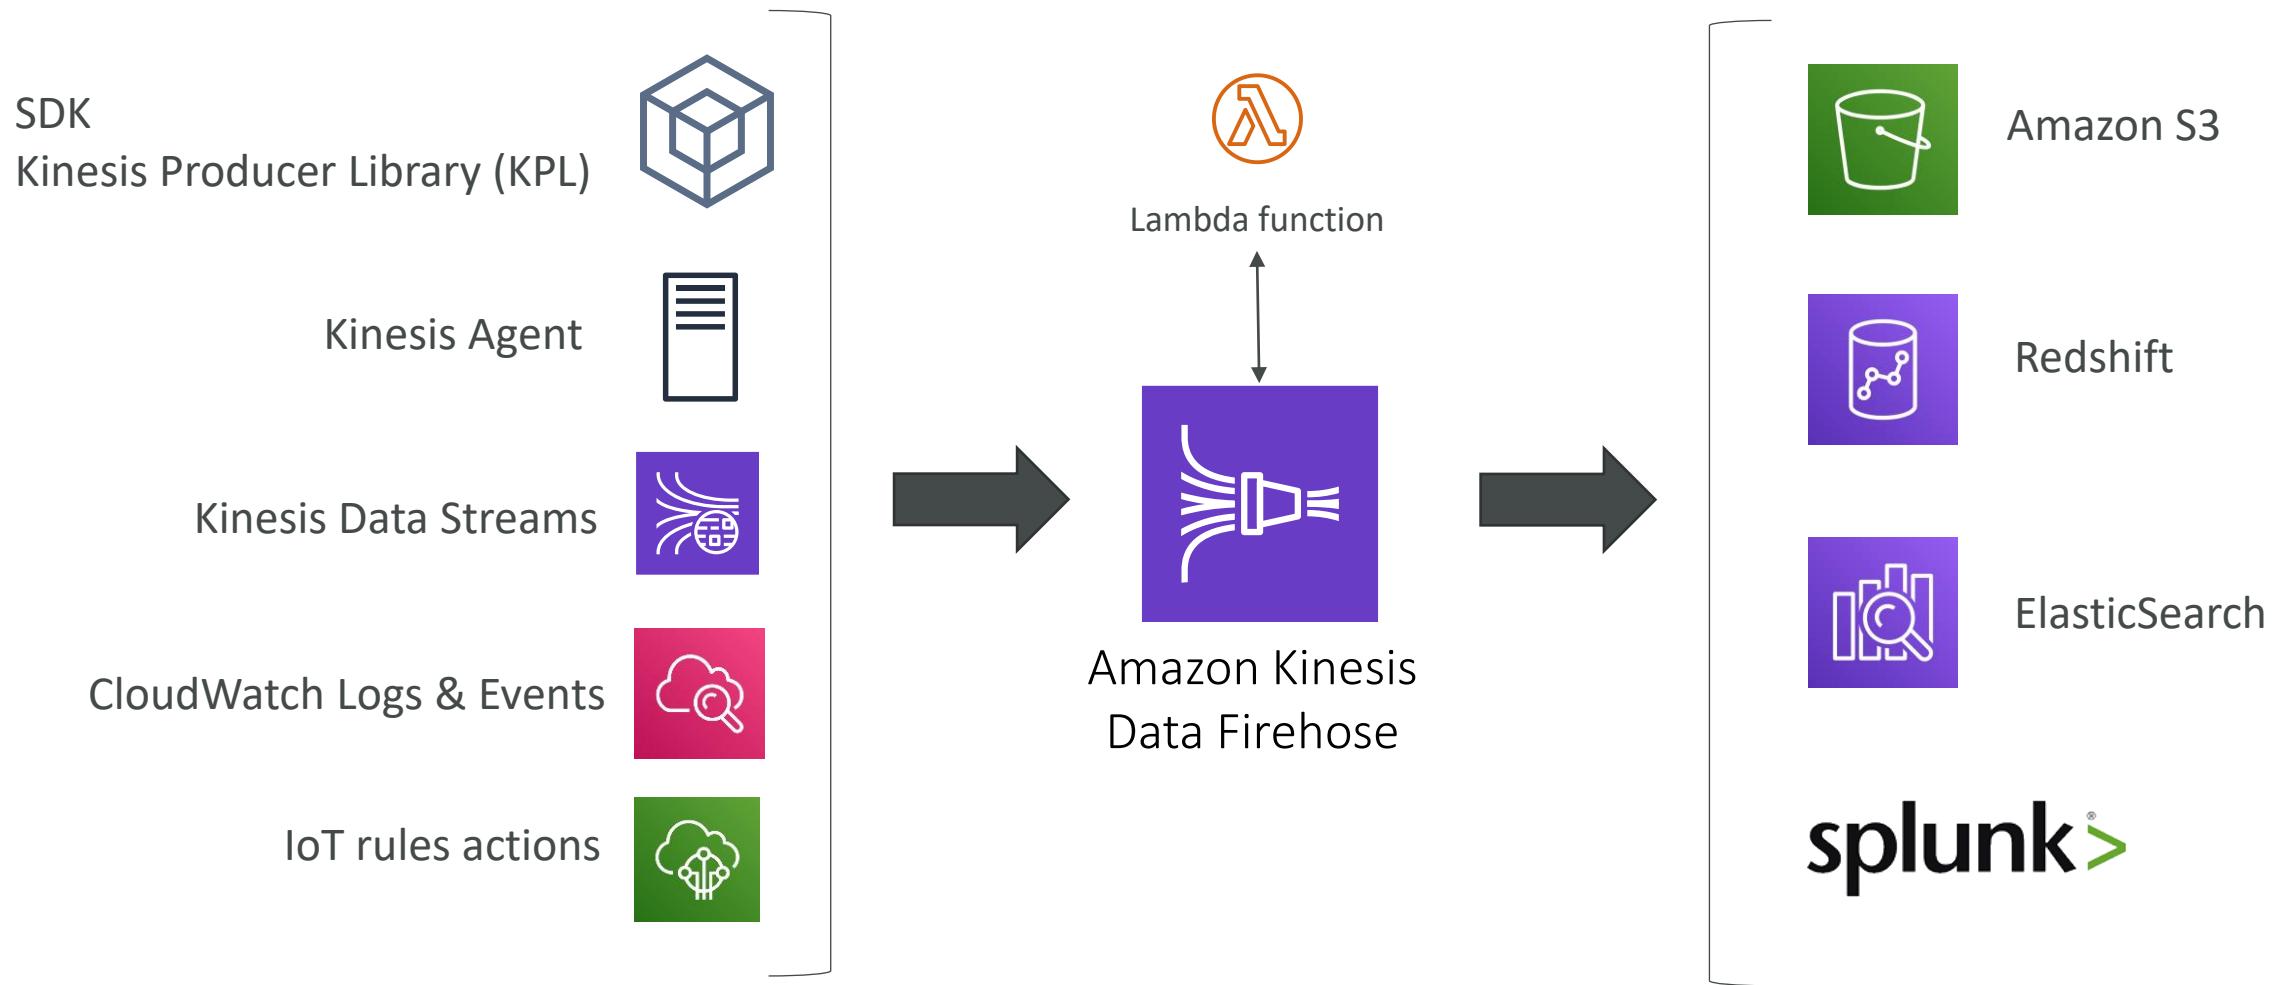

- Producer:
 - 1MB/s or 1000 messages/s at write PER SHARD
 - “ProvisionedThroughputException” otherwise
- Consumer Classic:
 - 2MB/s at read PER SHARD across all consumers
 - 5 API calls per second PER SHARD across all consumers
- Data Retention:
 - 24 hours data retention by default
 - Can be extended to 7 days

Kinesis Data Firehose

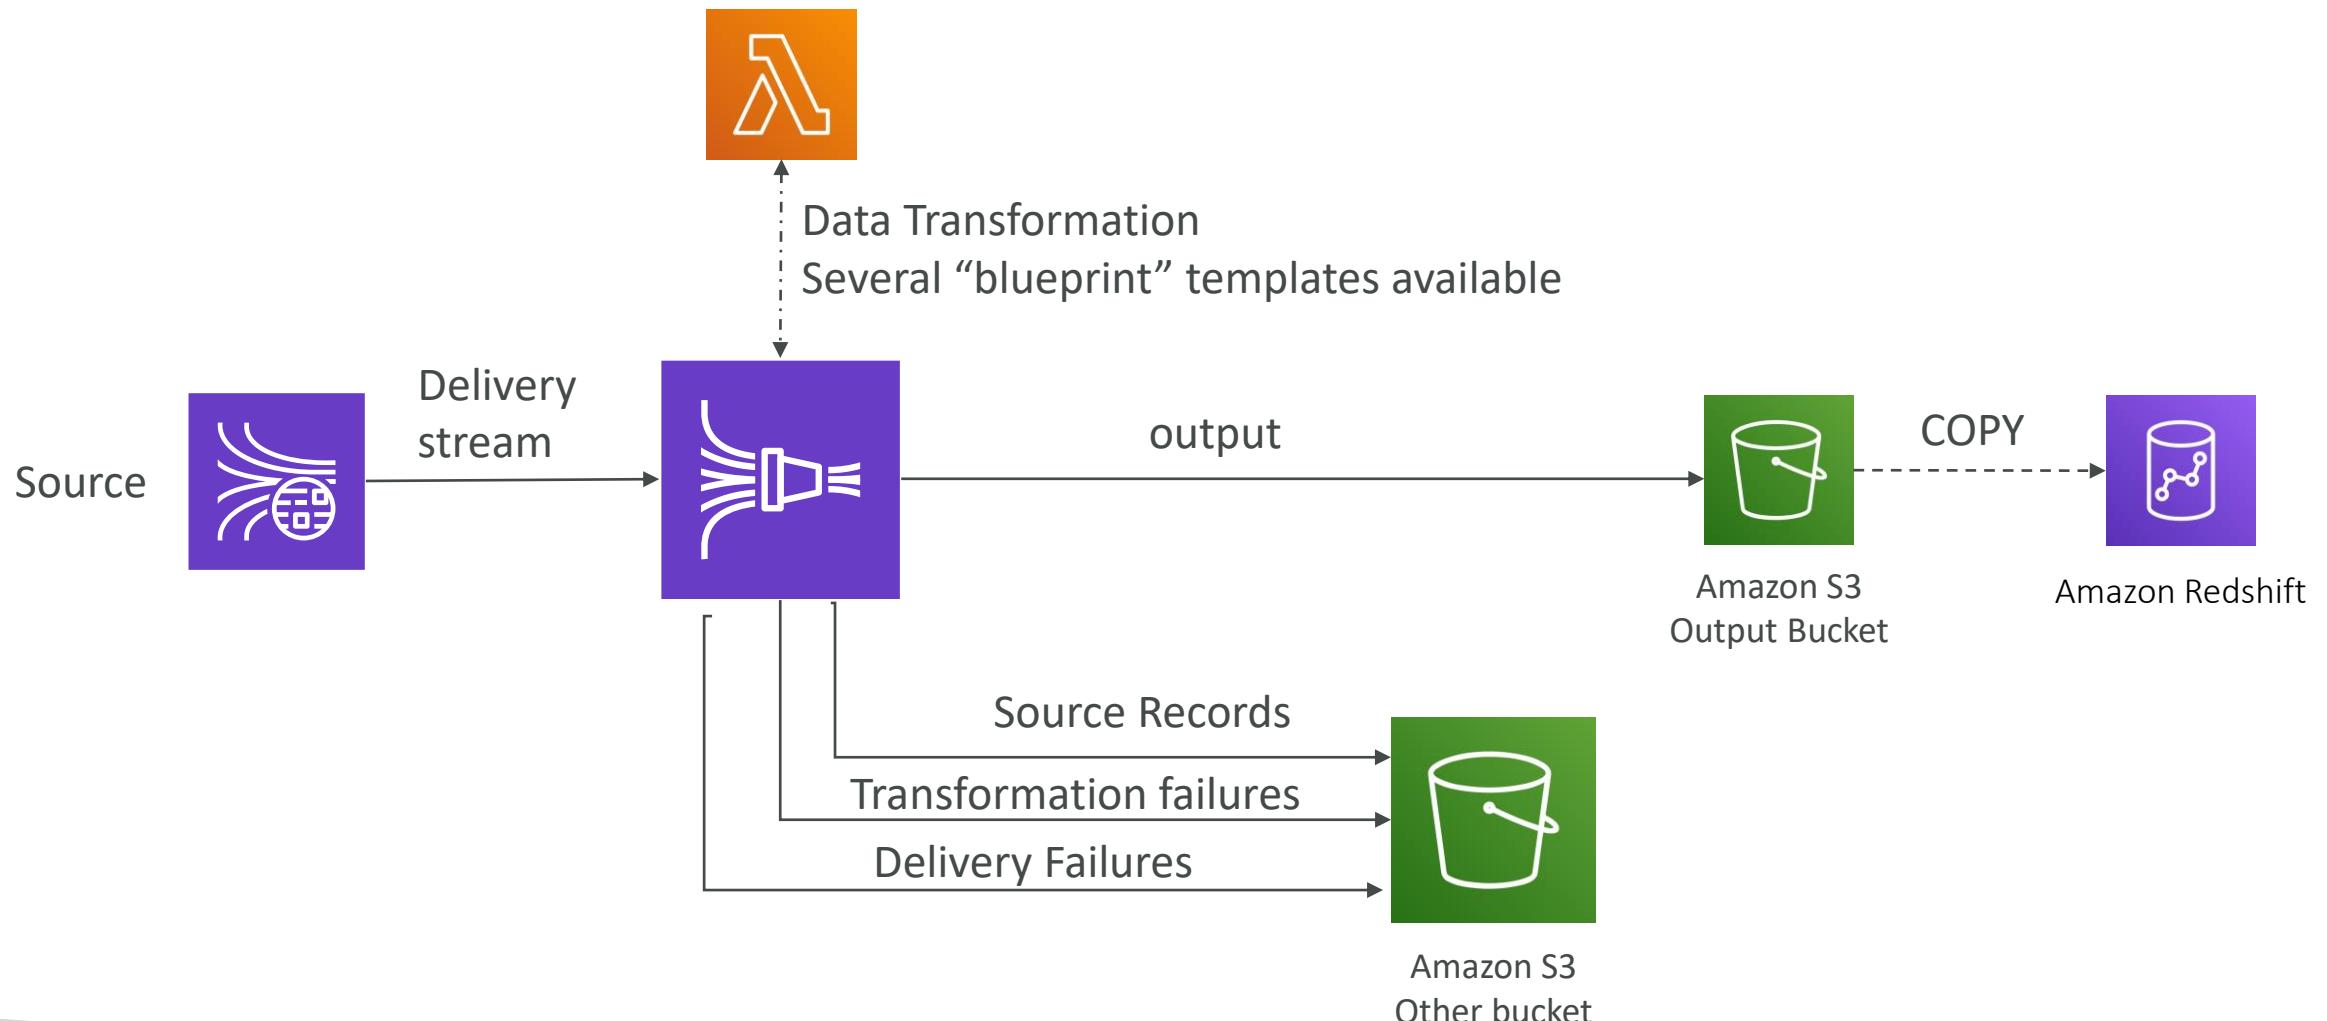

- Fully Managed Service, no administration
- **Near Real Time** (60 seconds latency minimum for non full batches)
- **Data Ingestion into Redshift / Amazon S3 / ElasticSearch / Splunk**
- **Automatic scaling**
- Supports many data formats
- **Data Conversions from CSV / JSON to Parquet / ORC (only for S3)**
- Data Transformation through AWS Lambda (ex: CSV => JSON)
- Supports **compression** when target is Amazon S3 (GZIP, ZIP, and SNAPPY)
- Pay for the amount of data going through Firehose

Kinesis Data Firehose Diagram

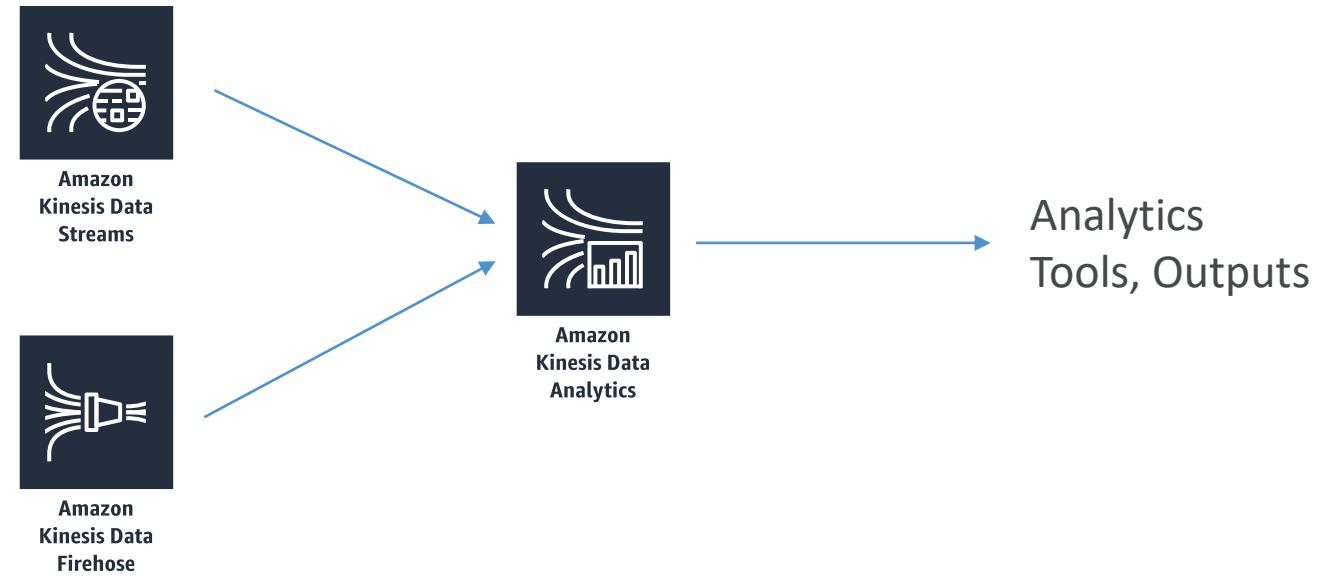

Kinesis Data Firehose Delivery Diagram

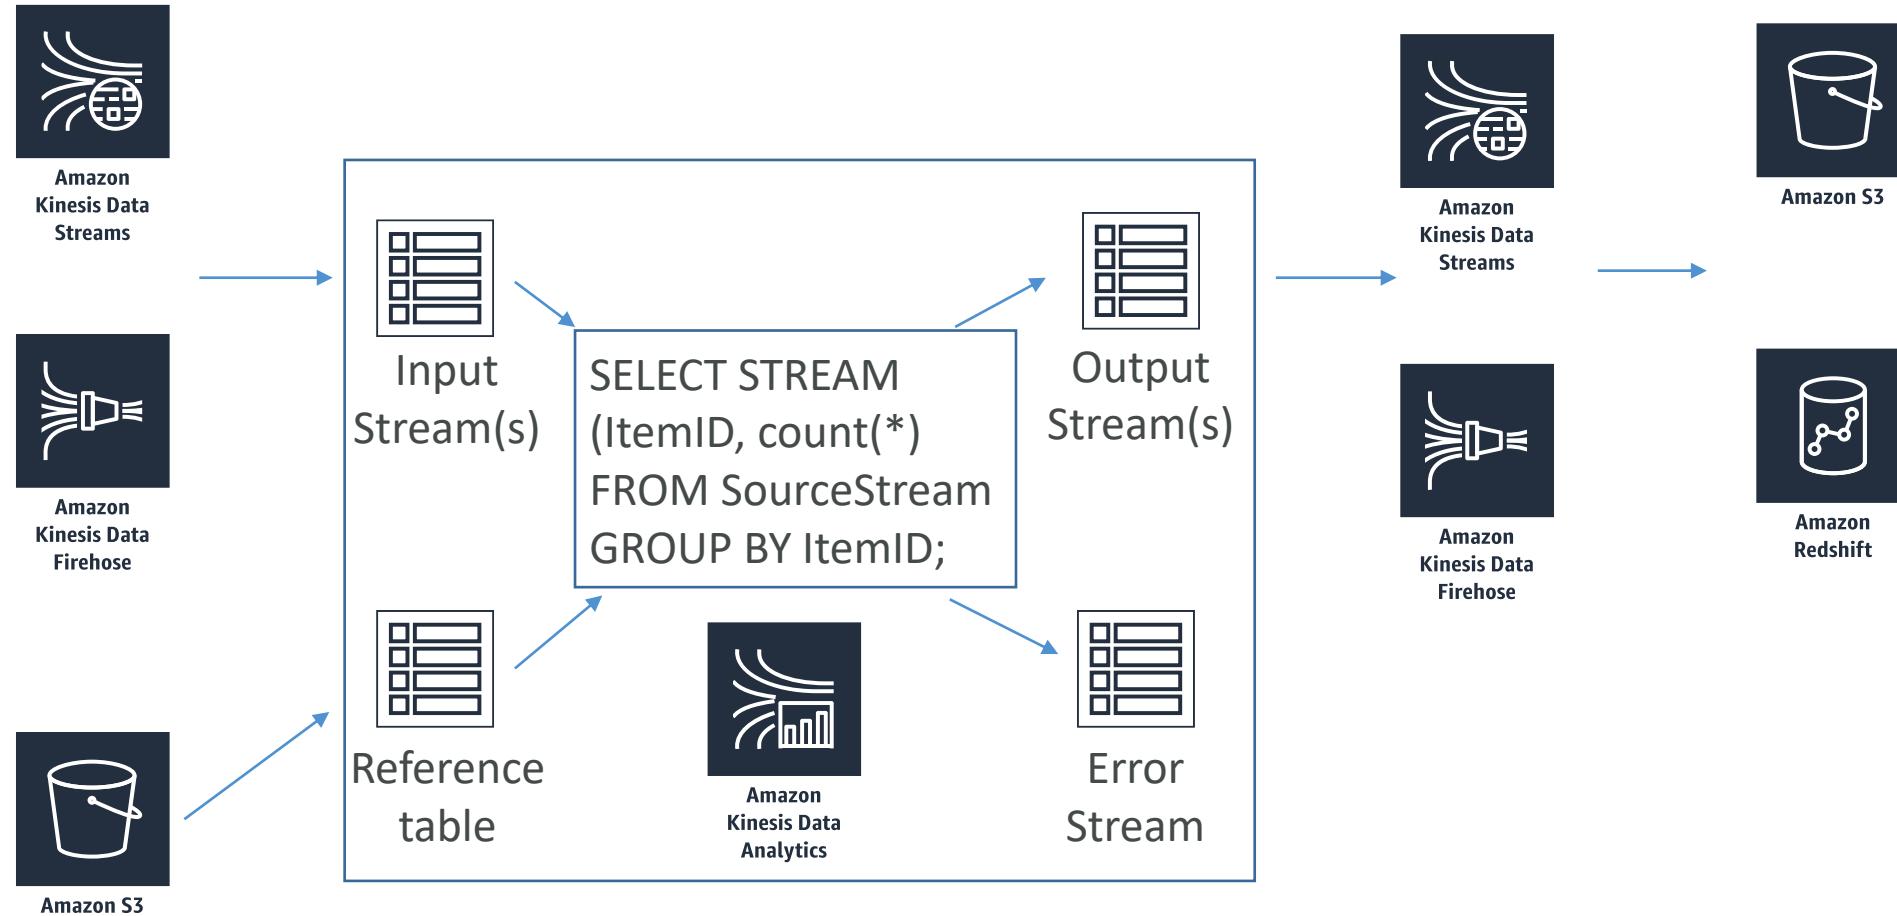

Kinesis Data Streams vs Firehose

- Streams
 - Going to write custom code (producer / consumer)
 - Real time (~200 ms latency for classic, ~70 ms latency for enhanced fan-out)
 - Must manage scaling (shard splitting / merging)
 - Data Storage for 1 to 7 days, replay capability, multi consumers
- Firehose
 - Fully managed, send to S3, Splunk, Redshift, ElasticSearch
 - Serverless data transformations with Lambda
 - **Near** real time (lowest buffer time is 1 minute)
 - Automated Scaling
 - No data storage

Kinesis Analytics, Conceptually...

Kinesis Analytics, In more depth...

Kinesis Data Analytics

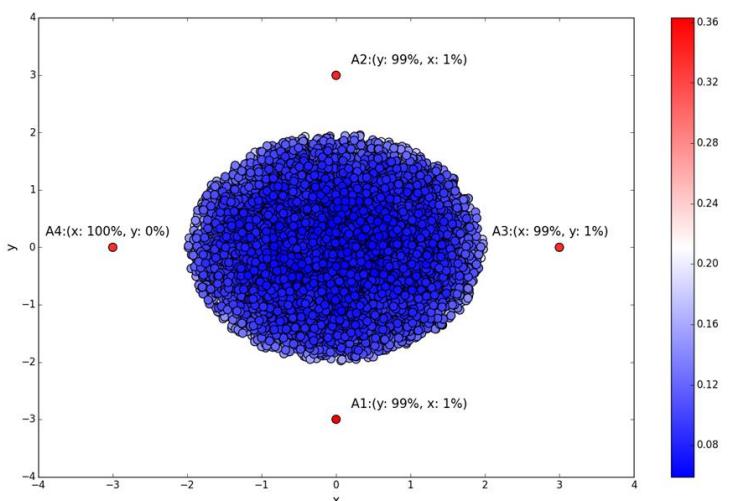

- Use cases
 - Streaming ETL: **select columns**, make simple transformations, on streaming data
 - Continuous metric generation: live leaderboard for a mobile game
 - Responsive analytics: look for certain criteria and build alerting (filtering)
- Features
 - Pay only for resources consumed (but it's not cheap)
 - Serverless; scales automatically
 - Use IAM permissions to access streaming source and destination(s)
 - SQL or Flink to write the computation
 - Schema discovery
 - Lambda can be used for pre-processing

Machine Learning on Kinesis Data Analytics

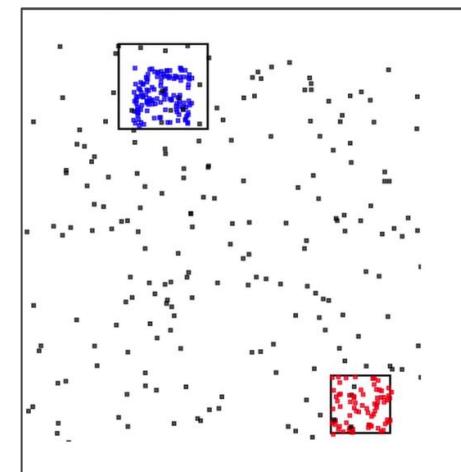

- **RANDOM_CUT_FOREST**

- SQL function used for **anomaly detection** on numeric columns in a stream
- Example: detect anomalous subway ridership during the NYC marathon
- Uses **recent history** to compute model

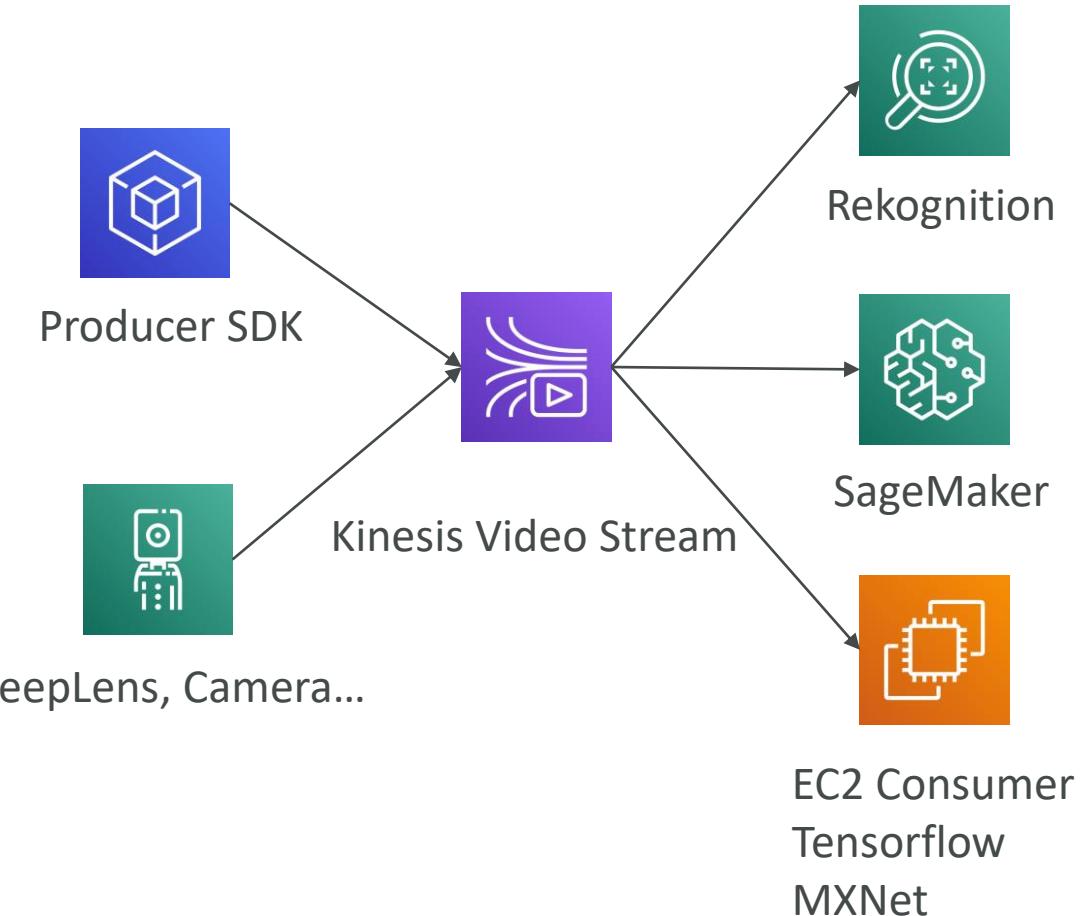

- **HOTSPOTS**

- locate and return information about relatively dense regions in your data
- Example: a collection of overheated servers in a data center

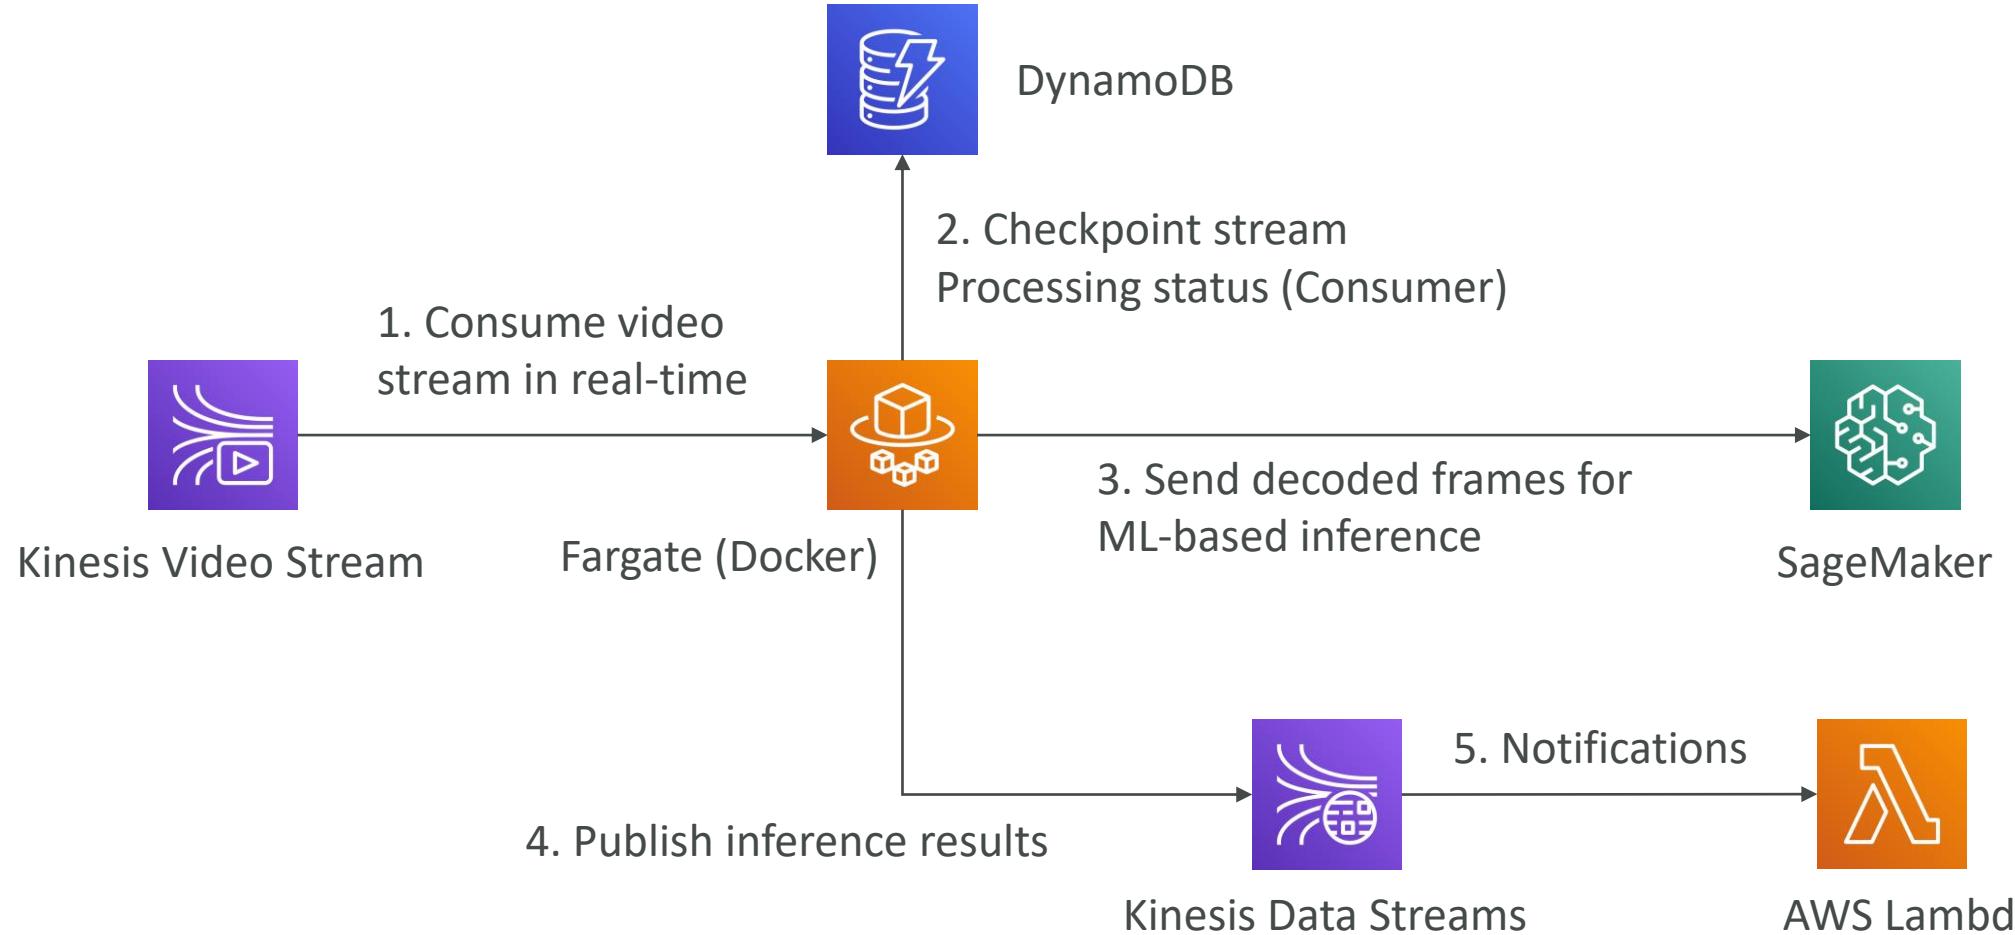

Kinesis Video Stream

- Producers:
 - security camera, body-worn camera, **AWS DeepLens**, smartphone camera, audio feeds, images, RADAR data, **RTSP camera**.
 - One producer per video stream
- Video playback capability
- Consumers
 - build your own (MXNet, Tensorflow)
 - **AWS SageMaker**
 - **Amazon Rekognition Video**
- Keep data for 1 hour to 10 years

Kinesis Video Streams use cases

<https://aws.amazon.com/blogs/machine-learning/analyze-live-video-at-scale-in-real-time-using-amazon-kinesis-video-streams-and-amazon-sagemaker/>

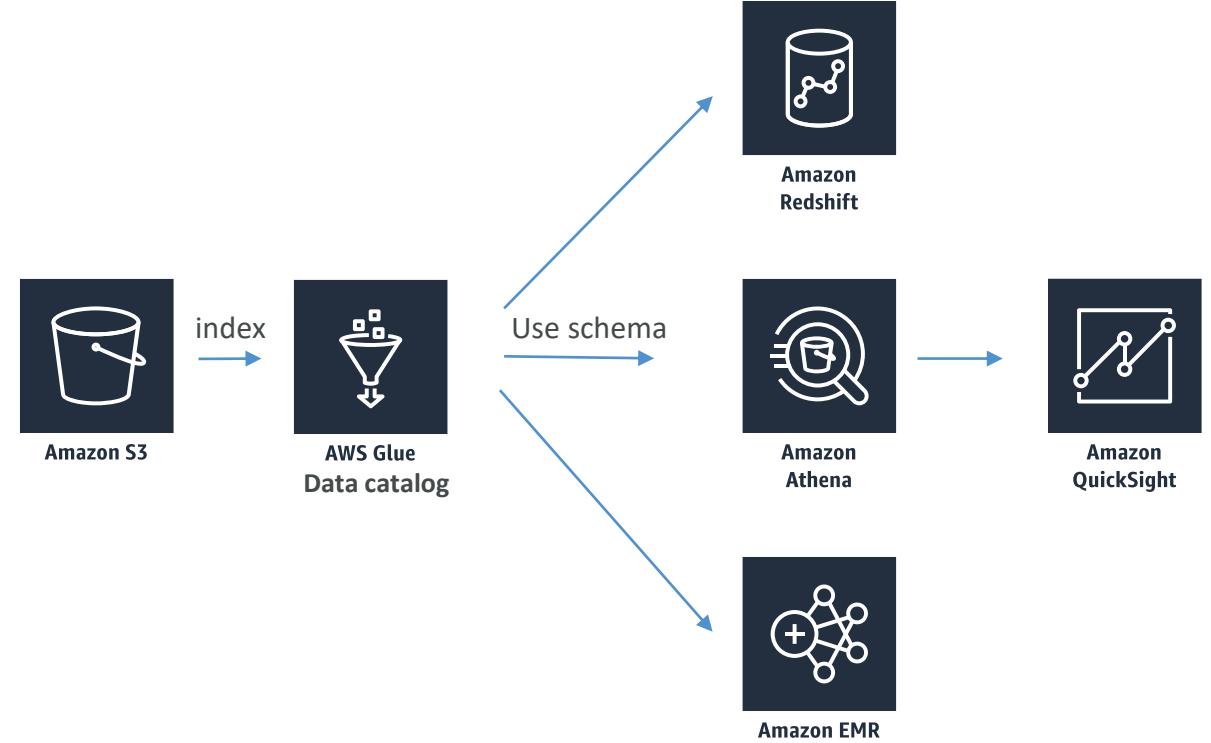

Kinesis Summary – Machine Learning

- Kinesis Data Stream: create real-time machine learning applications
- Kinesis Data Firehose: ingest massive data near-real time
- Kinesis Data Analytics: real-time ETL / ML algorithms on streams
- Kinesis Video Stream: real-time video stream to create ML applications

Glue Data Catalog

- Metadata repository for all your tables
 - Automated Schema Inference
 - Schemas are versioned
- Integrates with Athena or Redshift Spectrum (schema & data discovery)
- **Glue Crawlers** can help build the **Glue Data Catalog**

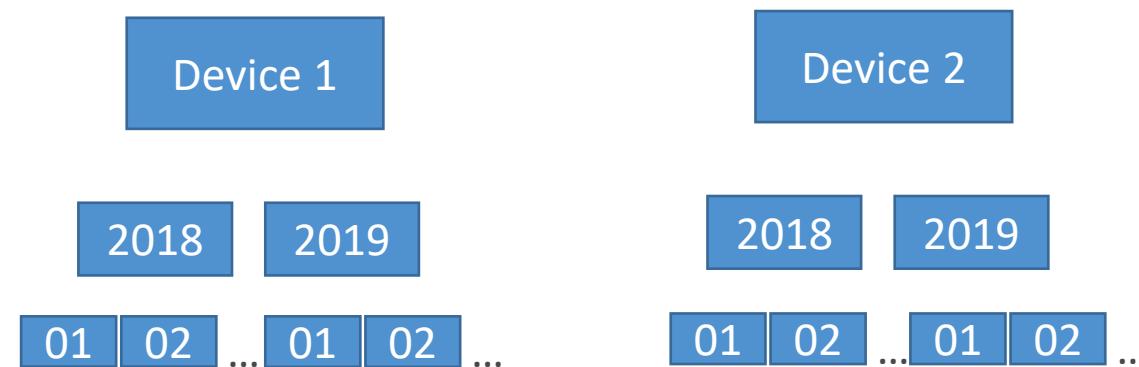

Glue Data Catalog - Crawlers

- **Crawlers** go through your data to infer schemas and partitions
- Works JSON, Parquet, CSV, relational store
- Crawlers work for: S3, Amazon Redshift, Amazon RDS
- Run the Crawler on a Schedule or On Demand

- Need an IAM role / credentials to access the data stores

Glue and S3 Partitions

- Glue crawler will extract partitions based on how your S3 data is organized
- Think up front about how you will be querying your data lake in S3
- Example: devices send sensor data every hour
- Do you query primarily by **time ranges**?
 - If so, organize your buckets as s3://my-bucket/dataset/**yyyy/mm/dd/device**
- Do you query primarily by **device**?
 - If so, organize your buckets as s3://my-bucket/dataset/**device/yyyy/mm/dd**

Glue ETL

- Transform data, Clean Data, Enrich Data (before doing analysis)
 - Generate ETL code in Python or Scala, you can modify the code
 - Can provide your own Spark or PySpark scripts
 - Target can be S3, JDBC (RDS, Redshift), or in Glue Data Catalog
- Fully managed, cost effective, pay only for the resources consumed
- Jobs are run on a serverless Spark platform
- Glue Scheduler to schedule the jobs
- Glue Triggers to automate job runs based on “events”

Glue ETL - Transformations

- Bundled Transformations:
 - DropFields, DropNullFields – remove (null) fields
 - Filter – specify a function to filter records
 - Join – to enrich data
 - Map - add fields, delete fields, perform external lookups
- Machine Learning Transformations:
 - **FindMatches ML:** identify duplicate or matching records in your dataset, even when the records do not have a common unique identifier and no fields match exactly.
 - Format conversions: CSV, JSON, Avro, Parquet, ORC, XML
 - Apache Spark transformations (example: K-Means)

AWS Data Stores for Machine Learning

- Redshift:

- Data Warehousing, SQL analytics (OLAP - Online analytical processing)
- Load data from S3 to Redshift
- Use Redshift Spectrum to query data directly in S3 (no loading)

- RDS, Aurora:

- Relational Store, SQL (OLTP - Online Transaction Processing)
- Must provision servers in advance

AWS Data Stores for Machine Learning

- DynamoDB:
 - NoSQL data store, serverless, provision read/write capacity
 - Useful to store a machine learning model served by your application
- S3:
 - Object storage
 - Serverless, infinite storage
 - Integration with most AWS Services

AWS Data Stores for Machine Learning

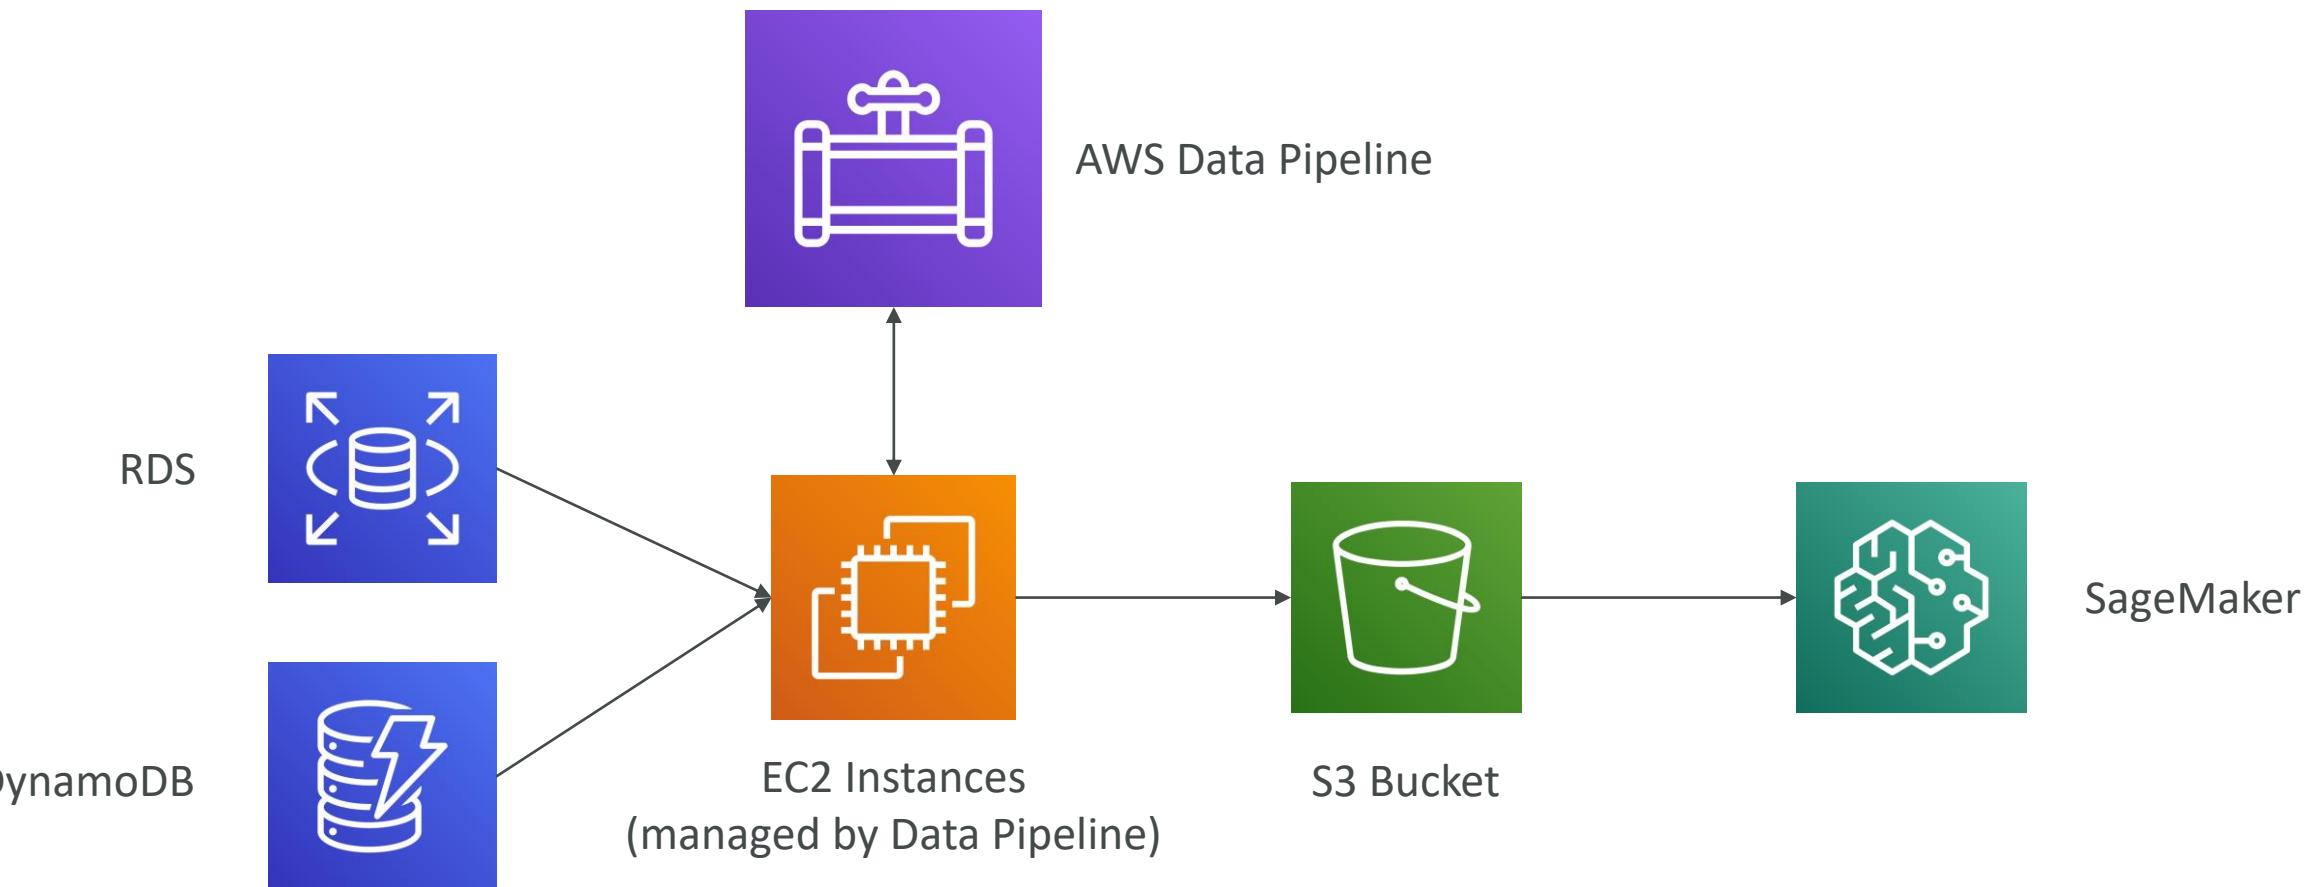

- ElasticSearch:
 - Indexing of data
 - Search amongst data points
 - Clickstream Analytics
- ElastiCache:
 - Caching mechanism
 - Not really used for Machine Learning

AWS Data Pipeline Features

- Destinations include S3, RDS, DynamoDB, Redshift and EMR
- Manages task dependencies
- Retries and notifies on failures
- Data sources may be on-premises
- Highly available

Data Pipeline example

AWS Data Pipeline vs Glue

- Glue:
 - Glue ETL - Run Apache Spark code, Scala or Python based, focus on the ETL
 - Glue ETL - Do not worry about configuring or managing the resources
 - Data Catalog to make the data available to Athena or Redshift Spectrum
- Data Pipeline:
 - Orchestration service
 - More control over the environment, compute resources that run code, & code
 - Allows access to EC2 or EMR instances (creates resources in your own account)

AWS Batch

- Run batch jobs as Docker images
- Dynamic provisioning of the instances (EC2 & Spot Instances)
- Optimal quantity and type based on volume and requirements
- No need to manage clusters, fully **serverless**
- You just pay for the underlying EC2 instances

- Schedule Batch Jobs using CloudWatch Events
- Orchestrate Batch Jobs using AWS Step Functions

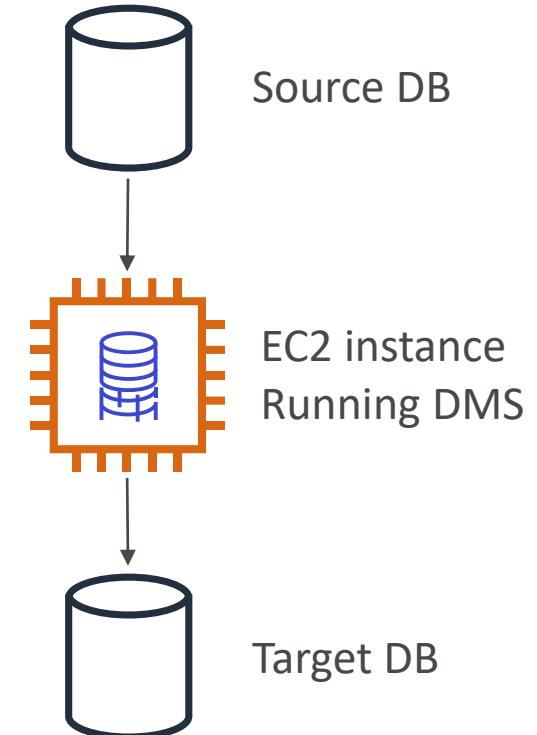

AWS Batch vs Glue

- Glue:
 - Glue ETL - Run Apache Spark code, Scala or Python based, focus on the ETL
 - Glue ETL - Do not worry about configuring or managing the resources
 - Data Catalog to make the data available to Athena or Redshift Spectrum
- Batch:
 - For any computing job regardless of the job (must provide Docker image)
 - Resources are created in your account, managed by Batch
 - For any non-ETL related work, Batch is probably better

DMS – Database Migration Service

- Quickly and securely migrate databases to AWS, resilient, self healing
- The source database remains available during the migration
- Supports:
 - Homogeneous migrations: ex Oracle to Oracle
 - Heterogeneous migrations: ex Microsoft SQL Server to Aurora
- Continuous Data Replication using CDC
- You must create an EC2 instance to perform the replication tasks

AWS DMS vs Glue

- Glue:
 - Glue ETL - Run Apache Spark code, Scala or Python based, focus on the ETL
 - Glue ETL - Do not worry about configuring or managing the resources
 - Data Catalog to make the data available to Athena or Redshift Spectrum
- AWS DMS:
 - Continuous Data Replication
 - No data transformation
 - Once the data is in AWS, you can use Glue to transform it

AWS Step Functions

- Use to design workflows
- Easy visualizations
- Advanced Error Handling and Retry mechanism outside the code
- Audit of the history of workflows
- Ability to “Wait” for an arbitrary amount of time
- Max execution time of a State Machine is 1 year

Step Functions – Examples

Train a Machine Learning Model

Definition

Code is pre-configured by the chosen sample project. It can be edited after creation. Step Functions state machines are defined using the JSON-based Amazon States Language (ASL). [Learn more](#)

23           "InstanceCount": 1,  
24           "InstanceType": "ml.m4.xlarge",  
25         }  
26       }  
27     }  
28   }  
29 }
```

```
graph TD; Start((Start)) --> Generate[Generate dataset]; Generate --> Train[Train model (XGBoost)]; Train --> Save[Save Model]; Save --> Batch[Batch transform]; Batch --> End((End));
```

Step Functions – Examples

Tune a Machine Learning Model

Definition

Code is pre-configured by the chosen sample project. It can be edited after creation. Step Functions state machines are defined using the JSON-based Amazon States Language (ASL). [Learn more](#)

```
1  {
2      "StartAt": "Generate Training Dataset",
3      "States": {
4          "Generate Training Dataset": {
5              "Resource": "<GENERATE_LAMBDA_FUNCTION_ARN>",
6              "Type": "Task",
7              "Next": "HyperparameterTuning (XGBoost)"
8          },
9          "HyperparameterTuning (XGBoost)": {
10             "Resource": "arn:
<PARTITION>:states:::sagemaker:createHyperParameterTuningJob.sync",
11             "Parameters": {
12                 "HyperParameterTuningJobName.$": "
<JOB_NAME_FROM_LAMBDA>",
13                 "HyperParameterTuningJobConfig": {
14                     "Strategy": "Bayesian",
15                     "HyperParameterTuningJobObjective": {
16                         "Type": "Minimize",
17                         "MetricName": "validation:rmse"
18                     },
19                     "ResourceLimits": {
20                         "MaxNumberOfTrainingJobs": 2,
21                         "MaxParallelTrainingJobs": 2
22                     },
23                     "ParameterRanges": {
```

The diagram illustrates a Step Functions state machine for tuning a machine learning model. It begins with a yellow Start state, followed by a sequence of tasks enclosed in dashed boxes: 'Generate Training Dataset', 'HyperparameterTuning (XGBoost)', 'Extract Model Path', 'HyperparameterTuning - Save Model', 'Extract Model Name', and 'Batch transform'. These tasks are connected sequentially by arrows. The 'HyperparameterTuning (XGBoost)' task is specifically highlighted with a larger box. The sequence concludes with a yellow End state.

Exploratory Data Analysis

Python is becoming ubiquitous

- But the test will not test your Python knowledge.

```
In [1]: %matplotlib inline  
import numpy as np  
import pandas as pd
```

```
df = pd.read_csv("PastHires.csv")  
df.head()
```

Out[1]:

	Years Experience	Employed?	Previous employers	Level of Education	Top-tier school	Interned	Hired
0	10	Y	4	BS	N	N	Y
1	0	N	0	BS	Y	Y	Y
2	7	N	6	BS	N	N	N
3	2	Y	1	MS	Y	N	Y
4	20	N	2	PhD	Y	N	N

Pandas

- A Python library for slicing and dicing your data
 - Data Frames
 - Series
 - Interoperates with **numpy**

```
In [12]: df[['Years Experience', 'Hired']][:5]
```

```
Out[12]:
```

	Years Experience	Hired
0	10	Y
1	0	Y
2	7	N
3	2	Y
4	20	N

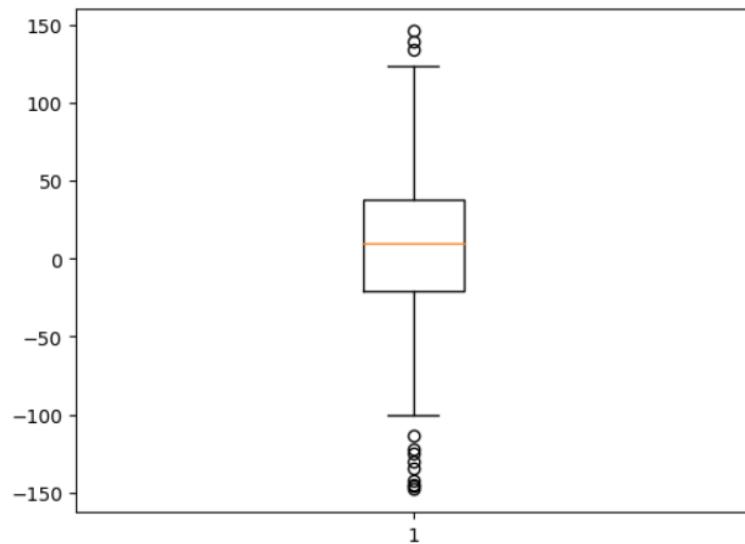

```
In [14]: degree_counts = df['Level of Education'].value_counts()  
degree_counts
```

```
Out[14]:
```

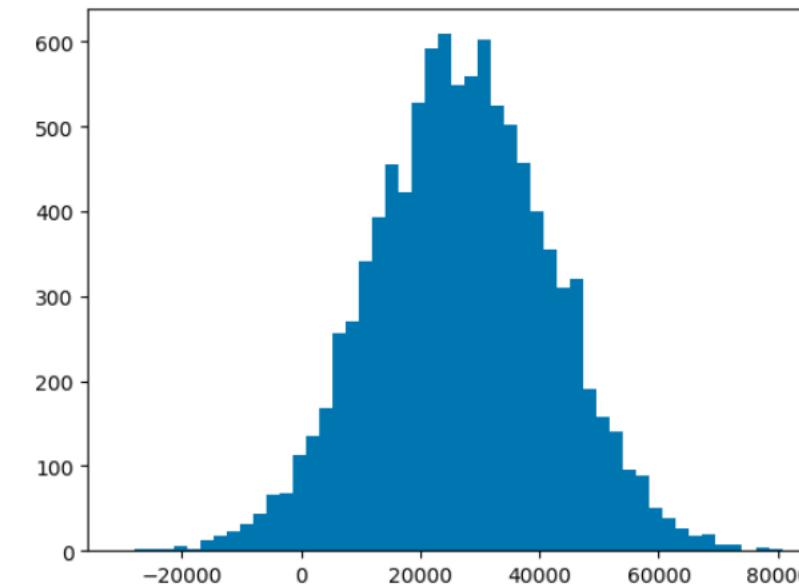

```
BS      7  
PhD     4  
MS      2  
Name: Level of Education, dtype: int64
```

Matplotlib

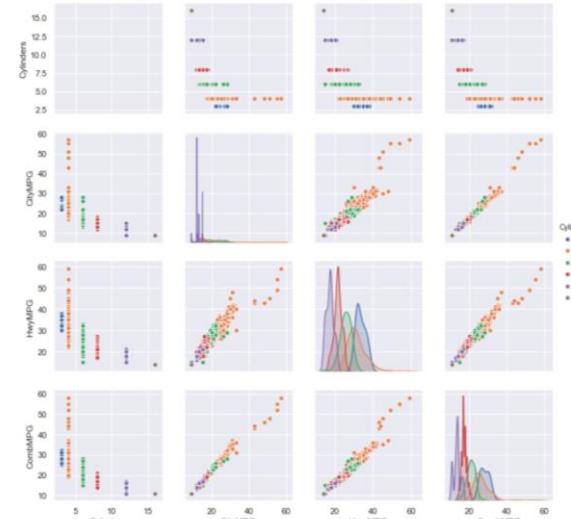

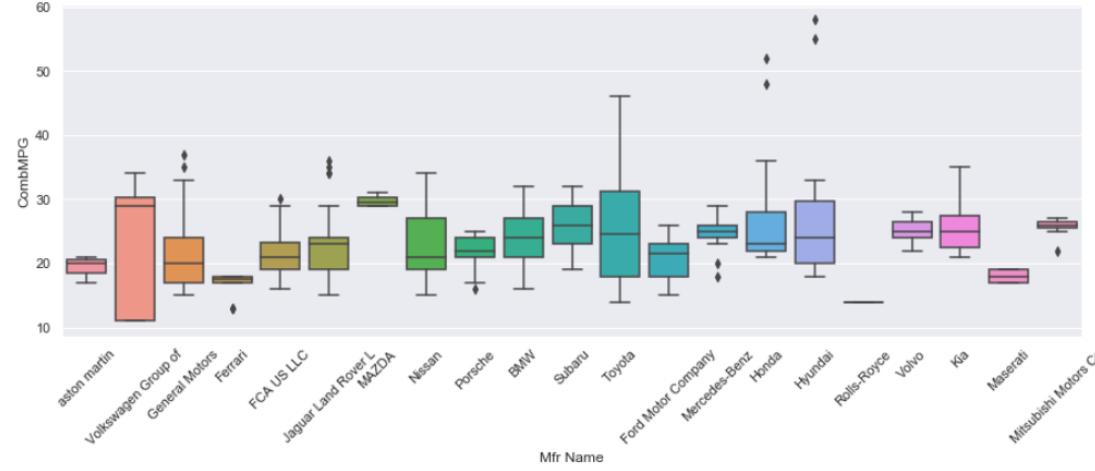

```
In [13]: uniformSkewed = np.random.rand(100) * 100 - 40
high_outliers = np.random.rand(10) * 50 + 100
low_outliers = np.random.rand(10) * -50 - 100
data = np.concatenate((uniformSkewed, high_outliers, low_outliers))
plt.boxplot(data)
plt.show()
```

```
In [12]: incomes = np.random.normal(27000, 15000, 10000)
plt.hist(incomes, 50)
plt.show()
```

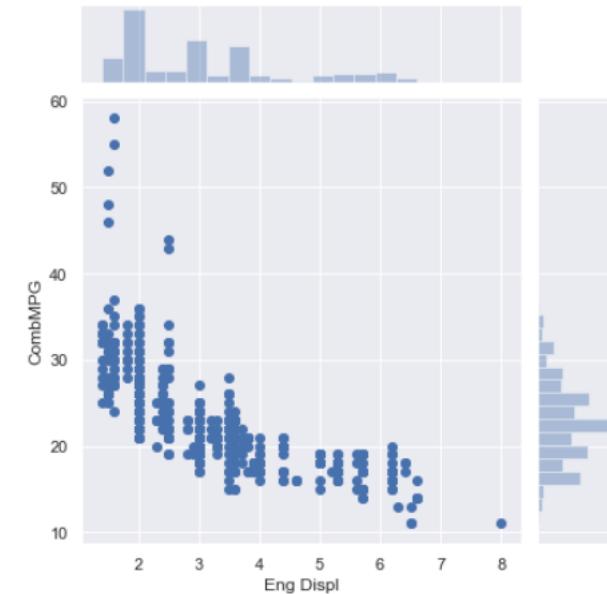

Seaborn

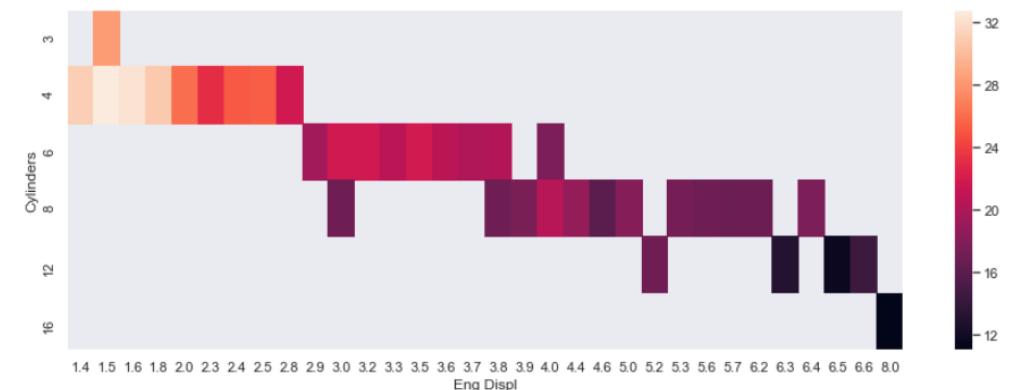

```
In [9]: sns.jointplot(x="Eng Displ", y="CombMPG", data=df)
```

```
Out[9]: <seaborn.axisgrid.JointGrid at 0x1d8a32f3e80>
```

```
In [14]: df2 = df.pivot_table(index='Cylinders', columns='Eng Displ', values='CombMPG', aggfunc='mean')
sns.heatmap(df2)
```

```
Out[14]: <matplotlib.axes._subplots.AxesSubplot at 0x1d8a31ceac8>
```

scikit_learn

- Python library for machine learning models

Ensemble learning: using a random forest

We'll use a random forest of 10 decision trees to predict employment of specific candidate profiles:

```
In [7]: from sklearn.ensemble import RandomForestClassifier

clf = RandomForestClassifier(n_estimators=10)
clf = clf.fit(X, y)

#Predict employment of an employed 10-year veteran
print (clf.predict([[10, 1, 4, 0, 0, 0]]))
#...and an unemployed 10-year veteran
print (clf.predict([[10, 0, 4, 0, 0, 0]]))

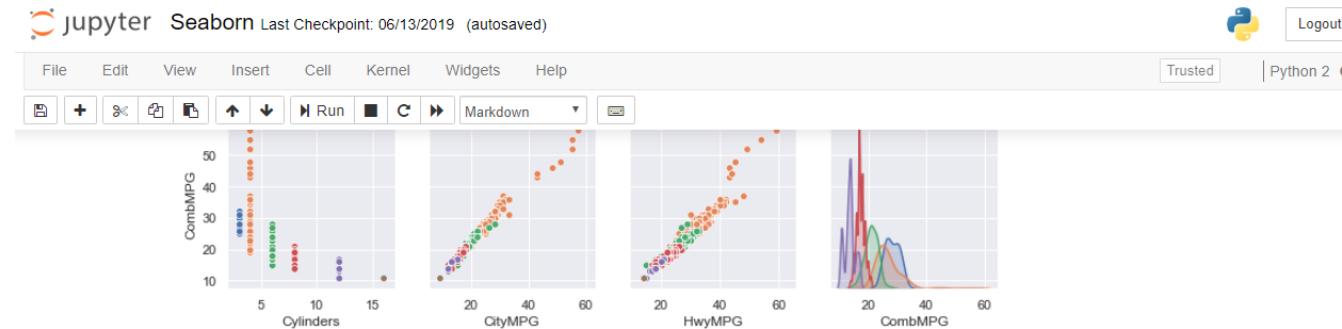

[1]
[0]
```

```
In [7]: from sklearn import preprocessing

scaler = preprocessing.StandardScaler()
all_features_scaled = scaler.fit_transform(all_features)
all_features_scaled

Out[7]: array([[ 0.7650629 ,  0.17563638,  1.39618483,  0.24046607],
   [ 0.15127063,  0.98104077,  1.39618483,  0.24046607],
   [-1.89470363, -1.43517241, -1.157718 ,  0.24046607],
   ...,
   [ 0.56046548,  0.98104077,  1.39618483,  0.24046607],
   [ 0.69686376,  0.98104077,  1.39618483,  0.24046607],
   [ 0.42406719,  0.17563638,  0.11923341,  0.24046607]])
```

Jupyter notebooks

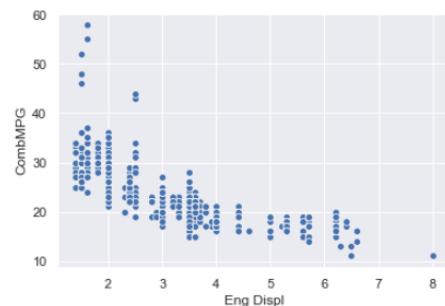

By studying the results above, you can see there is a relationship between number of cylinders and MPG, but MPG for 4-cylinder vehicles ranges really widely. There also appears to be a good linear relationship between the different ways of measuring MPG values, until you get into the higher MPG ratings.

Seaborn 1.9 also includes "scatterplot", which is exactly what it sounds like. It plots individual data points across two axes of your choosing, so you can see how your data is distributed across those dimensions.

```
In [8]: sns.scatterplot(x="Eng Displ", y="CombMPG", data=df)
```

```
Out[8]: <matplotlib.axes._subplots.AxesSubplot at 0x1d8a304dc18>
```

Seaborn also offers a "jointplot", which combines a scatterplot with histograms on both axes. This lets you visualize both the individual data points and the distribution across both dimensions at the same time.

Let's look at an example

Many Flavors of Data

Major Types of Data

- Numerical
- Categorical
- Ordinal

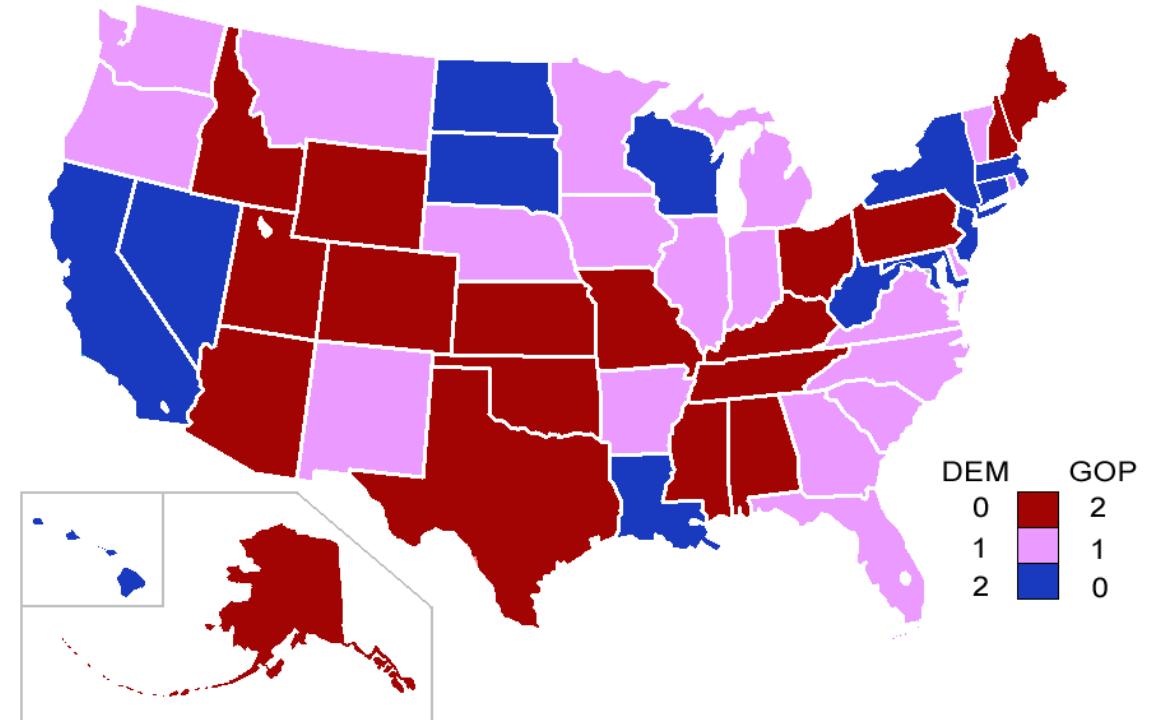

Numerical

- Represents some sort of quantitative measurement
 - Heights of people, page load times, stock prices, etc.
- Discrete Data
 - Integer based; often counts of some event.
 - How many purchases did a customer make in a year?
 - How many times did I flip “heads”?
- Continuous Data
 - Has an infinite number of possible values
 - How much time did it take for a user to check out?
 - How much rain fell on a given day?

Categorical

- Qualitative data that has no inherent mathematical meaning
 - Gender, Yes/no (binary data), Race, State of Residence, Product Category, Political Party, etc.
- You can assign numbers to categories in order to represent them more compactly, but the numbers don't have mathematical meaning

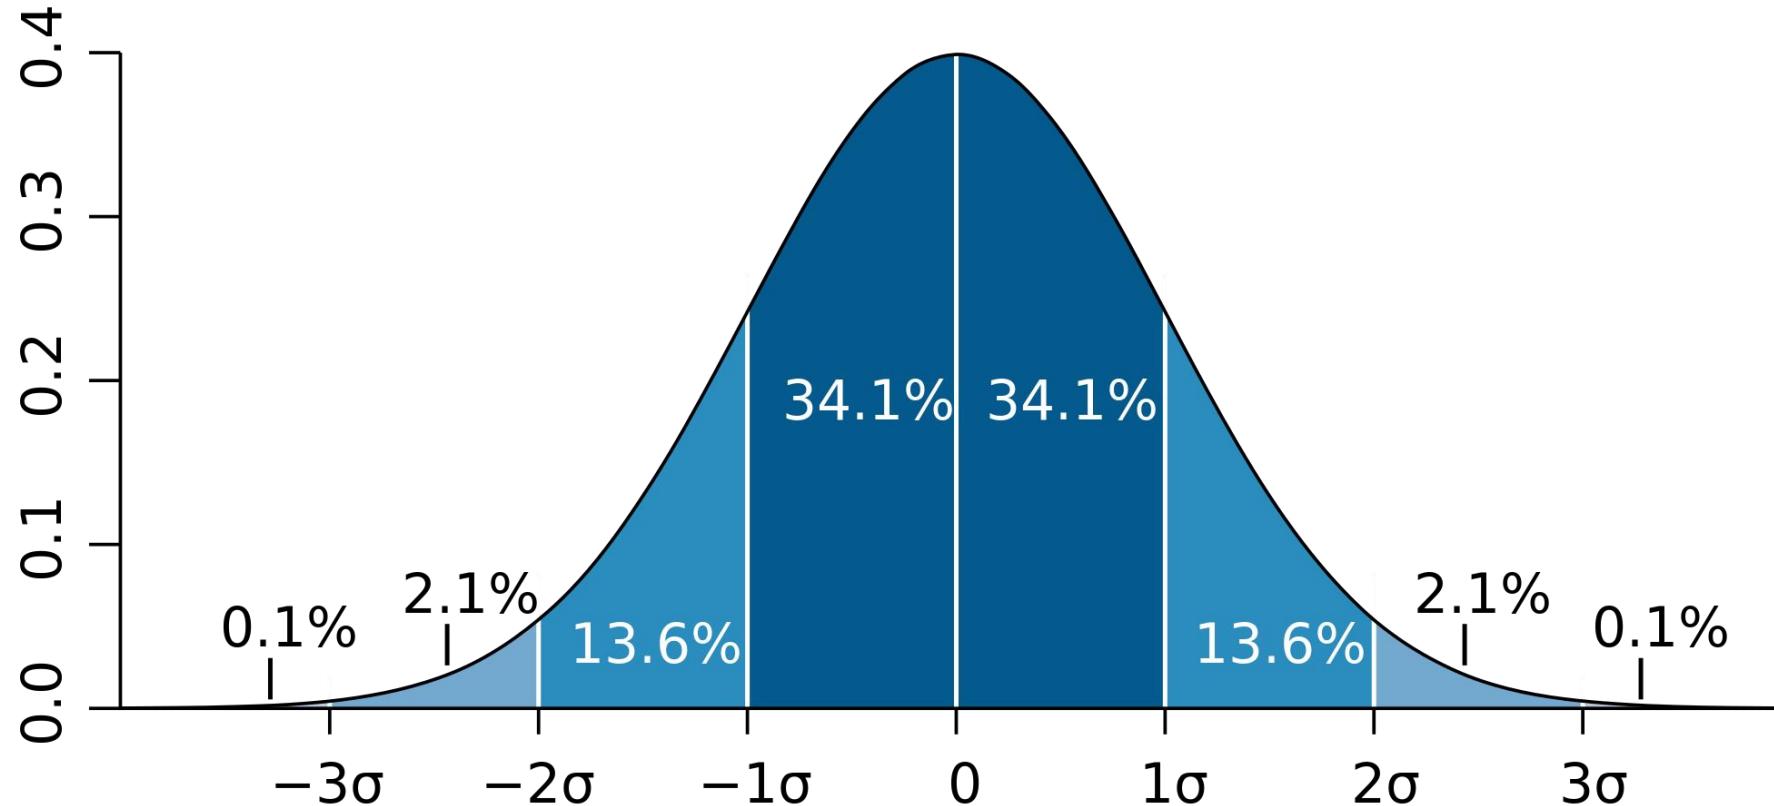

Ordinal

- A mixture of numerical and categorical
- Categorical data that has mathematical meaning
- Example: movie ratings on a 1-5 scale.
 - Ratings must be 1, 2, 3, 4, or 5
 - But these values have mathematical meaning; 1 means it's a worse movie than a 2.

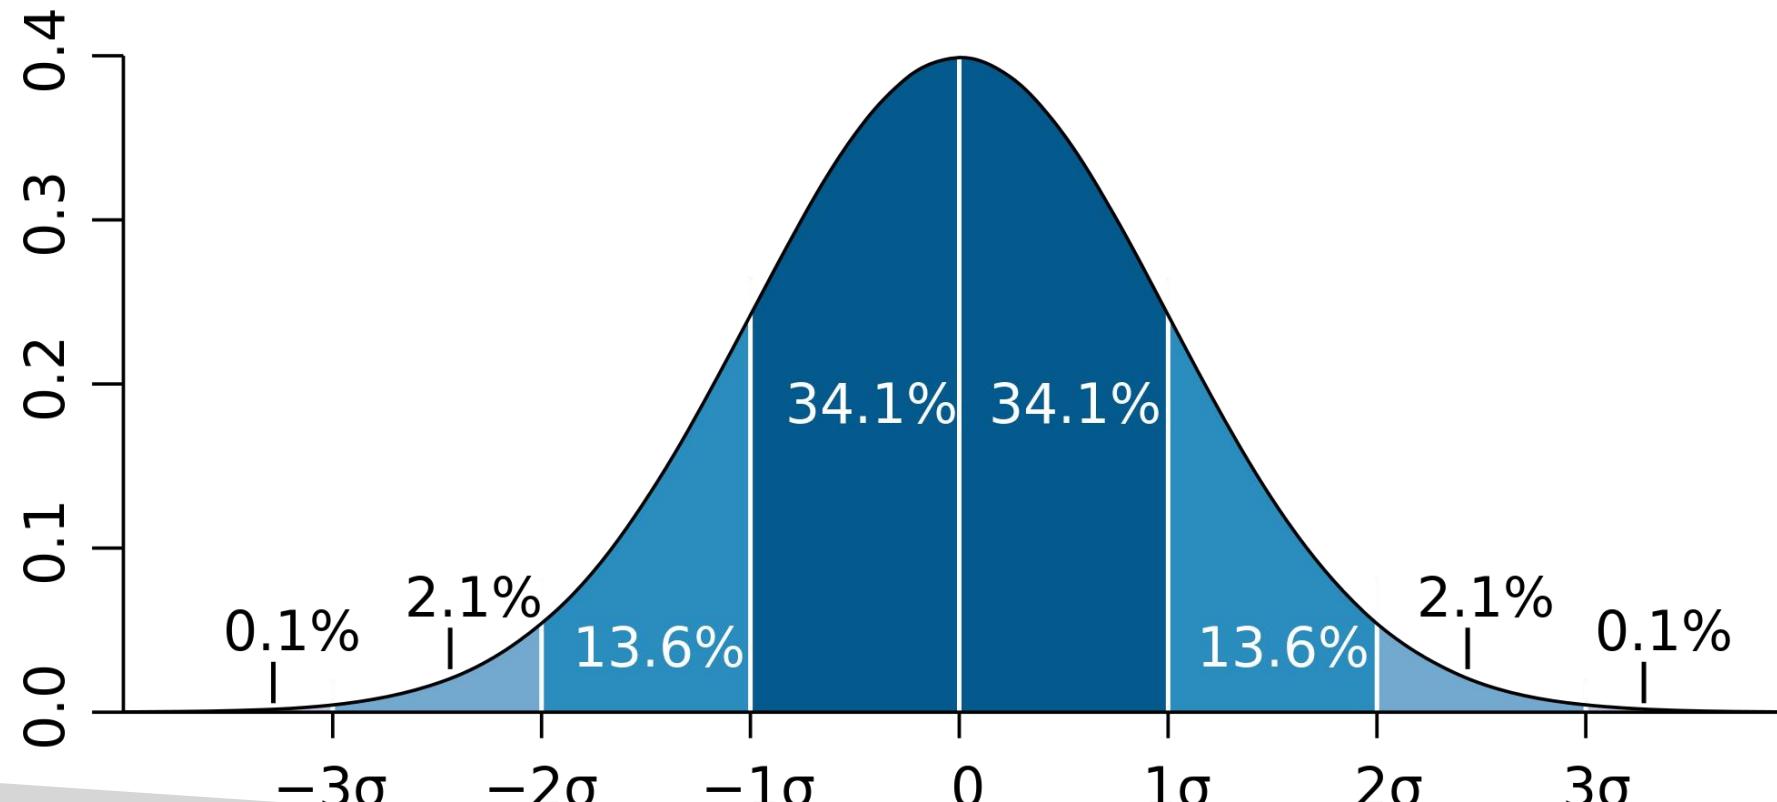

Data Distributions

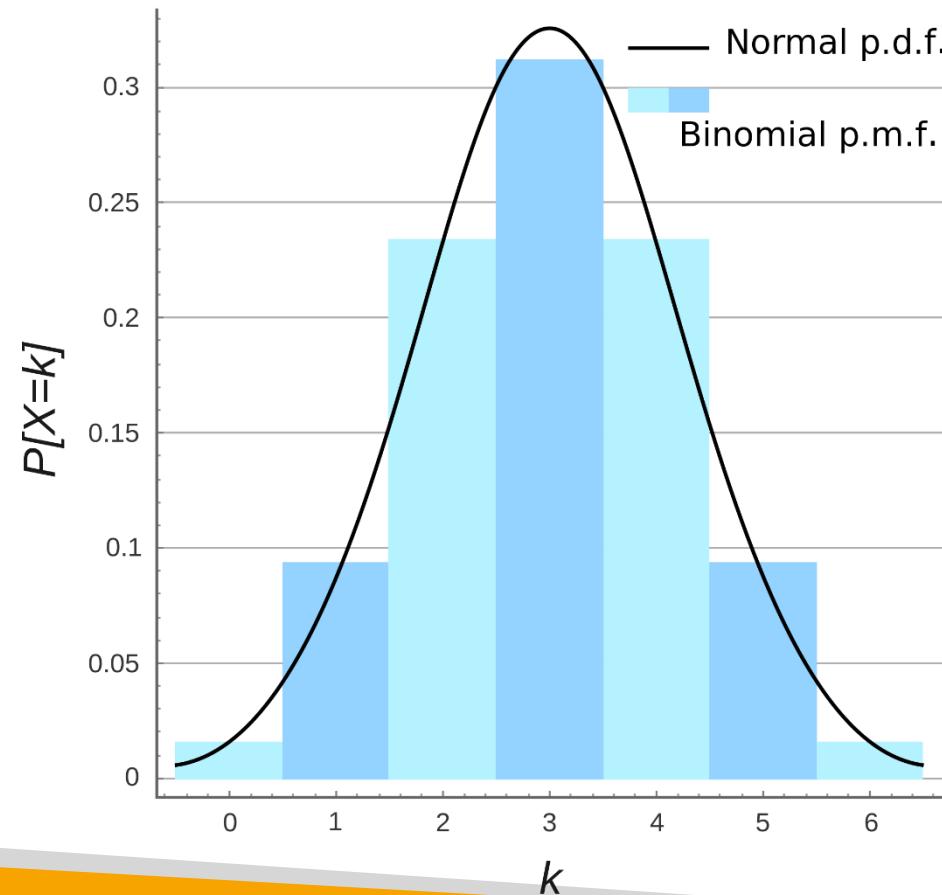

A “normal distribution”

Gives you the probability of a data point falling within some given range of a given value.

Probability Mass Function

Poisson Distribution

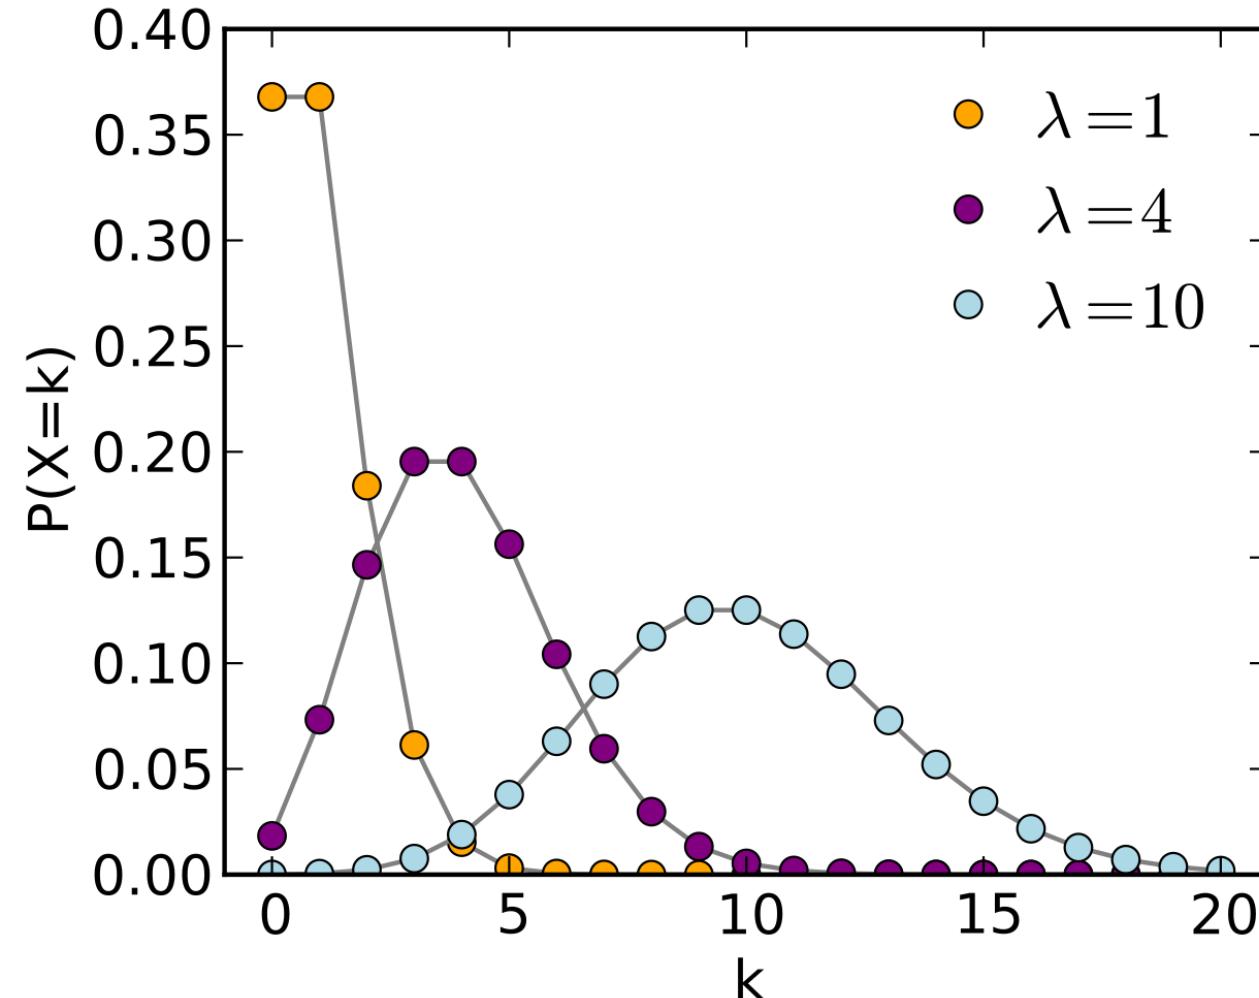

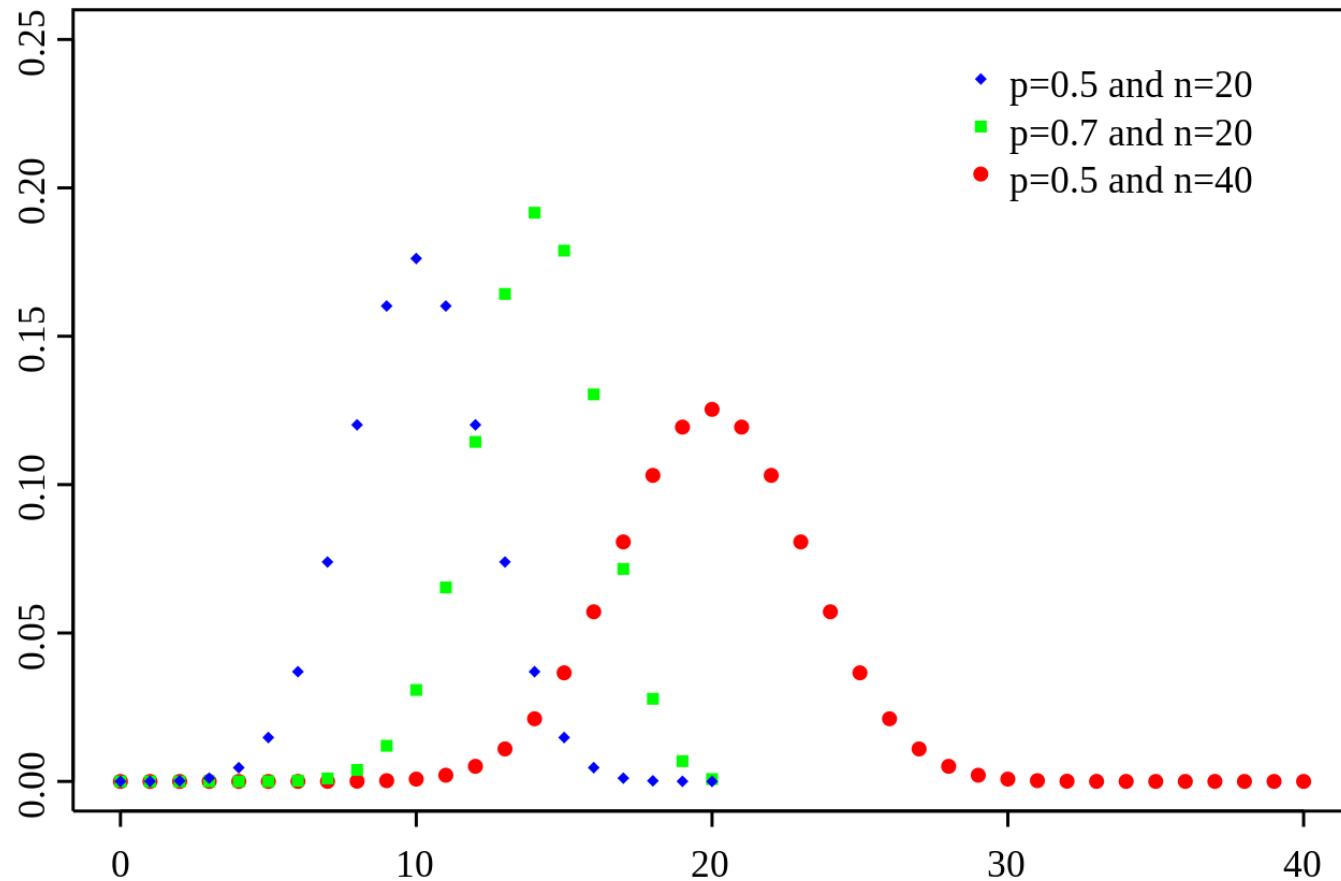

Image: Skbkekas, CC BY 3.0

Binomial Distribution

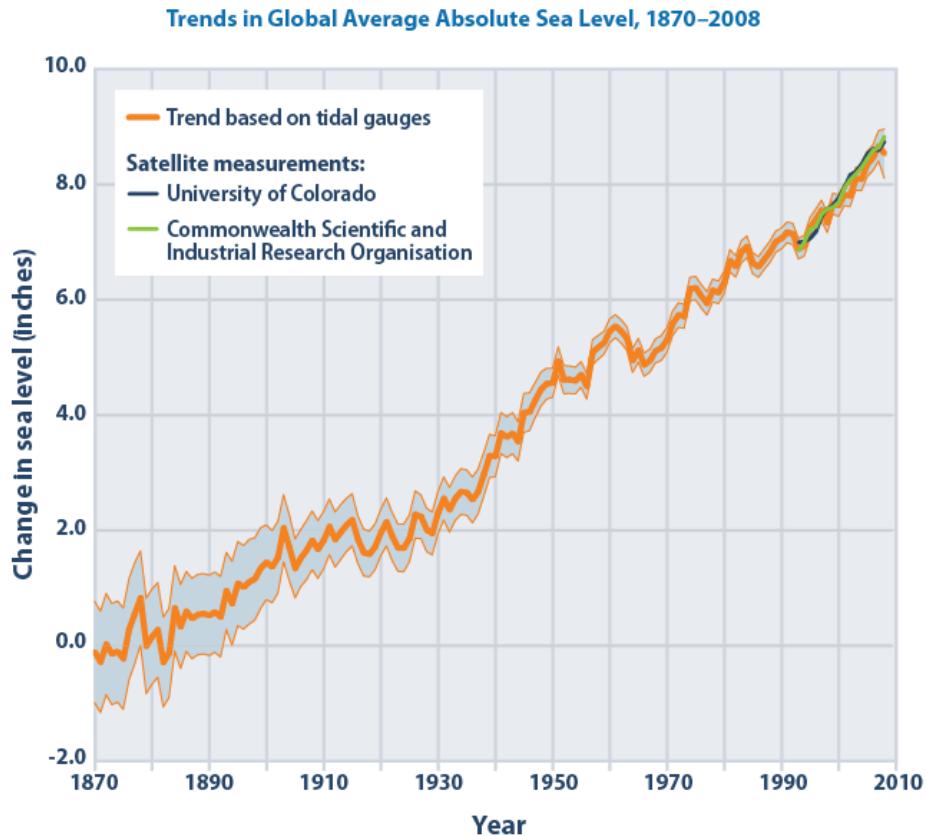

Bernoulli Distribution

- Special case of binomial distribution
- Has a single trial ($n=1$)
- Can think of a binomial distribution as the sum of Bernoulli distributions

Time Series Analysis

Trends

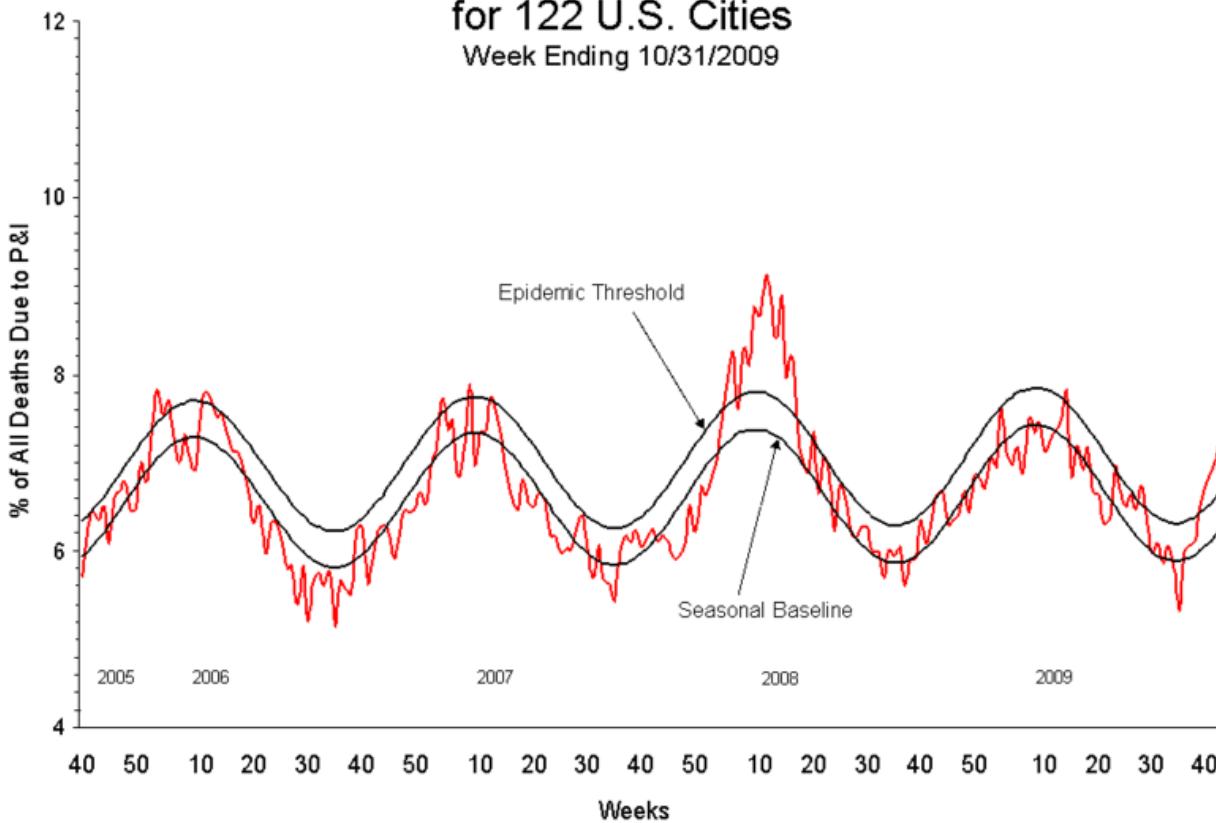

Data sources:

- CSIRO (Commonwealth Scientific and Industrial Research Organisation). 2009. Sea level rise. Accessed November 2009. <http://www.cmar.csiro.au/sealevel>.
- University of Colorado at Boulder. 2009. Sea level change: 2009 release #2. <http://sealevel.colorado.edu>.

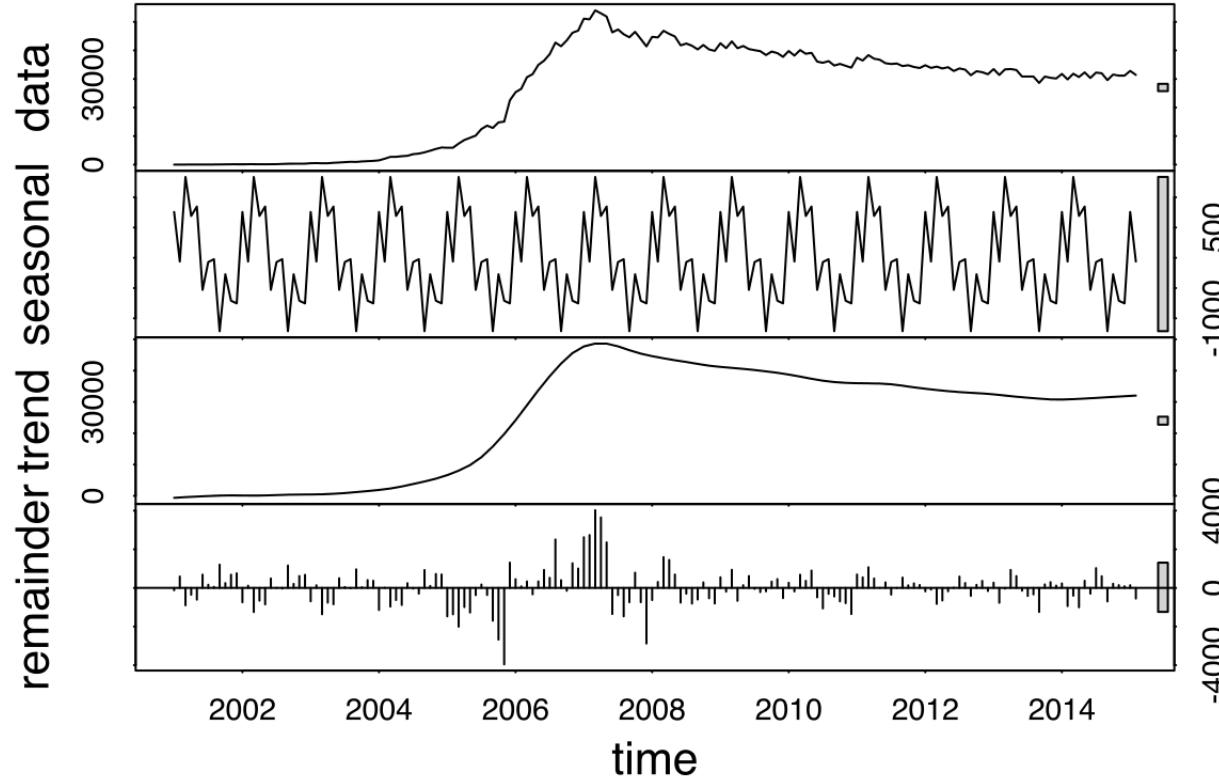

For more information, visit U.S. EPA's "Climate Change Indicators in the United States" at www.epa.gov/climatechange/science/Indicators.

Seasonality

Pneumonia and Influenza Mortality
for 122 U.S. Cities
Week Ending 10/31/2009

You can have both

Noise

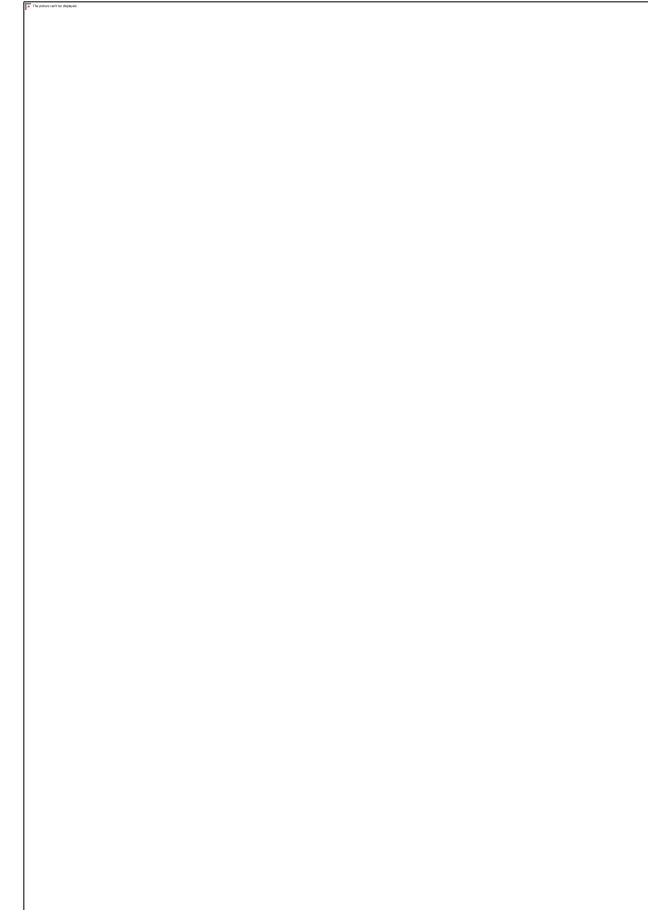

- Some variations are just random in nature
- Seasonality + Trends + Noise = time series
 - Additive model
 - Seasonal variation is constant
- Or sometimes, seasonality * trends * noise – trends sometimes amplify seasonality and noise.
 - Multiplicative model
 - Seasonal variation increases as the trend increases

Amazon Athena

Serverless interactive queries of S3 data

What is Athena?

- Interactive query service for S3 (SQL)
 - No need to load data, it stays in S3
- Presto under the hood
- Serverless!
- Supports many data formats
 - CSV (human readable)
 - JSON (human readable)
 - ORC (columnar, splittable)
 - Parquet (columnar, splittable)
 - Avro (splittable)
- Unstructured, semi-structured, or structured

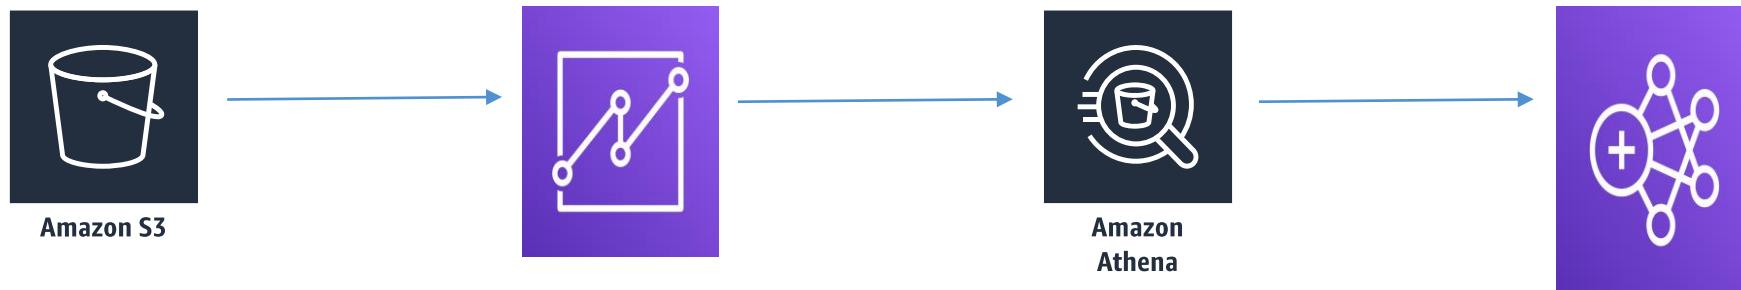

Some examples

- Ad-hoc queries of web logs
- Querying staging data before loading to Redshift
- Analyze CloudTrail / CloudFront / VPC / ELB etc logs in S3
- Integration with Jupyter, Zeppelin, RStudio notebooks
- Integration with QuickSight
- Integration via ODBC / JDBC with other visualization tools

```
43 USE AdventureworksLT;
44 GO
45 SELECT p.Name AS ProductName,
46 NonDiscountSales = (OrderQty * UnitPrice)
47 Discounts = ((OrderQty * UnitPrice) * TaxRate)
48 FROM Production.Product AS p
49 INNER JOIN Sales.SalesOrderDetail sod
50 ON p.ProductID = sod.ProductID
51 ORDER BY ProductName DESC;
52 GO
```

Athena + Glue

Athena cost model

- Pay-as-you-go
 - \$5 per TB scanned
 - Successful or cancelled queries count, failed queries do not.
 - No charge for DDL (CREATE/ALTER/DROP etc.)
- Save LOTS of money by using columnar formats
 - ORC, Parquet
 - Save 30-90%, and get better performance
- Glue and S3 have their own charges

Athena Security

- Access control
 - IAM, ACLs, S3 bucket policies
 - AmazonAthenaFullAccess / AWSQuicksightAthenaAccess
- Encrypt results at rest in S3 staging directory
 - Server-side encryption with S3-managed key (SSE-S3)
 - Server-side encryption with KMS key (SSE-KMS)
 - Client-side encryption with KMS key (CSE-KMS)
- Cross-account access in S3 bucket policy possible
- Transport Layer Security (TLS) encrypts in-transit (between Athena and S3)

Athena anti-patterns

- Highly formatted reports / visualization
 - That's what QuickSight is for
- ETL
 - Use Glue instead

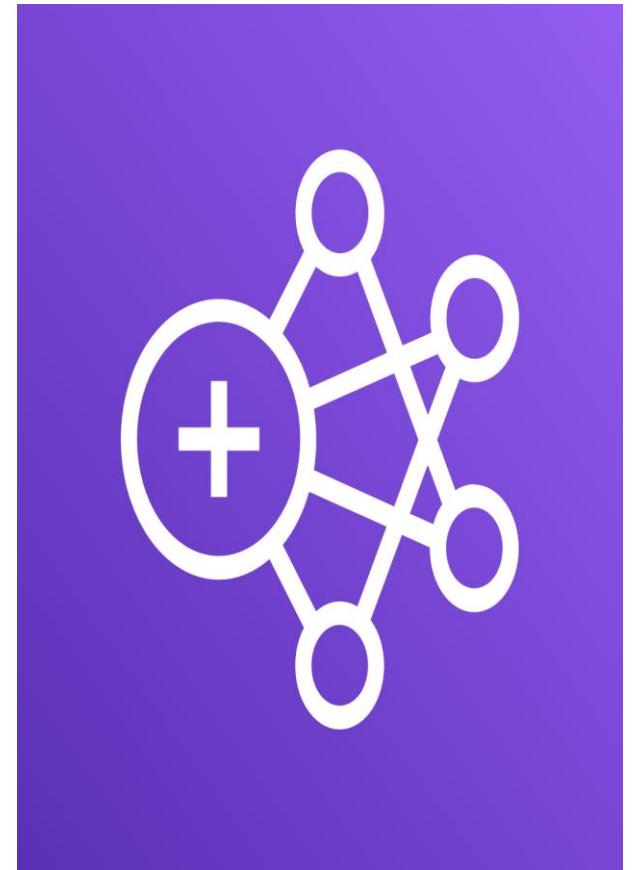

Amazon QuickSight

Business analytics and visualizations in the cloud

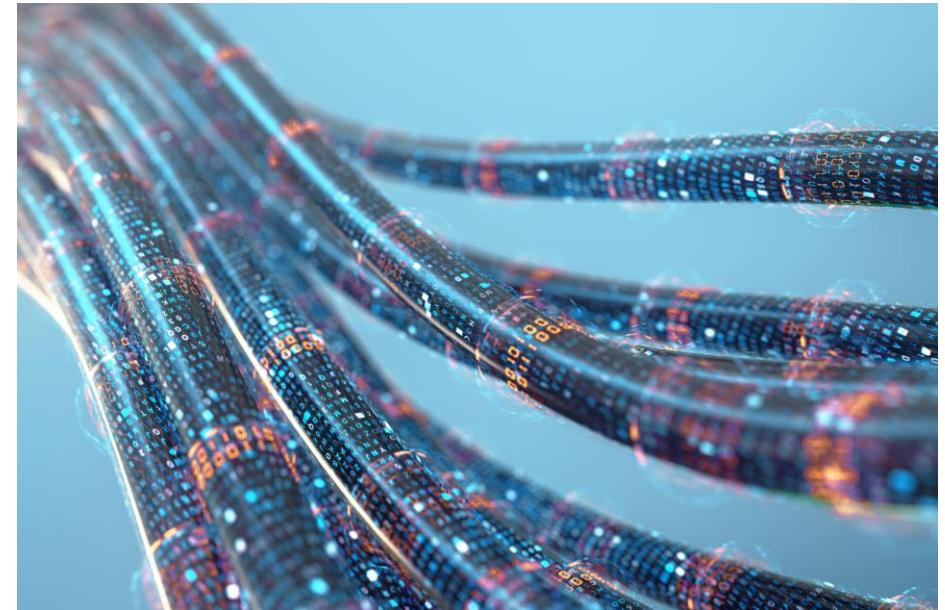

What is QuickSight?

- Fast, easy, cloud-powered business analytics service
- Allows all employees in an organization to:
 - Build visualizations
 - Perform ad-hoc analysis
 - Quickly get business insights from data
 - Anytime, on any device (browsers, mobile)
- Serverless

QuickSight Data Sources

- Redshift
- Aurora / RDS
- Athena
- EC2-hosted databases
- Files (S3 or on-premises)
 - Excel
 - CSV, TSV
 - Common or extended log format
- Data preparation allows limited ETL

SPICE

- Data sets are imported into SPICE
 - Super-fast, Parallel, In-memory Calculation Engine
 - Uses columnar storage, in-memory, machine code generation
 - Accelerates interactive queries on large datasets
- Each user gets 10GB of SPICE
- Highly available / durable
- Scales to hundreds of thousands of users

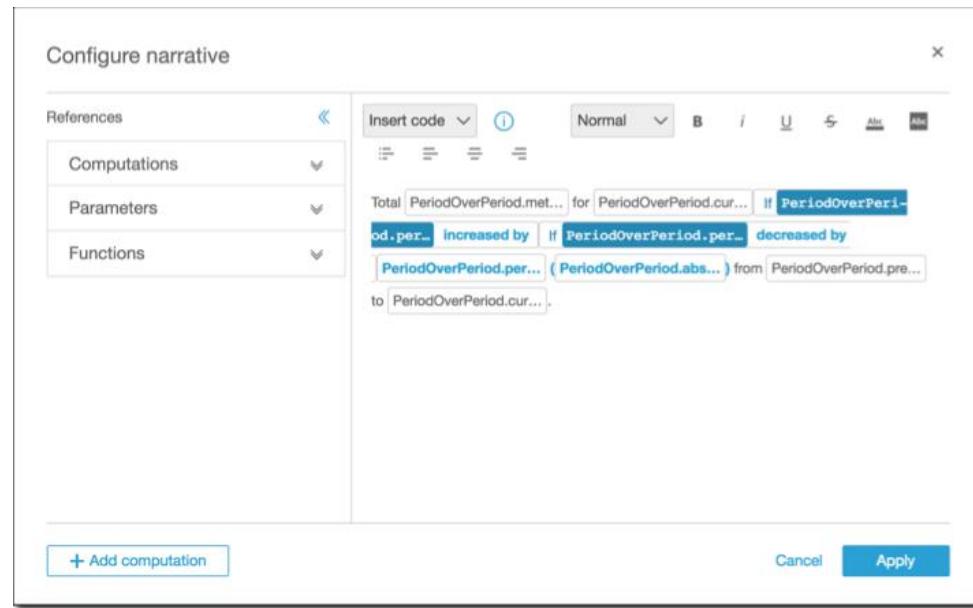

QuickSight Use Cases

- Interactive ad-hoc exploration / visualization of data
- Dashboards and KPI's
- Stories
 - Guided tours through specific views of an analysis
 - Convey key points, thought process, evolution of an analysis
- Analyze / visualize data from:
 - Logs in S3
 - On-premise databases
 - AWS (RDS, Redshift, Athena, S3)
 - SaaS applications, such as Salesforce
 - Any JDBC/ODBC data source

Machine Learning Insights

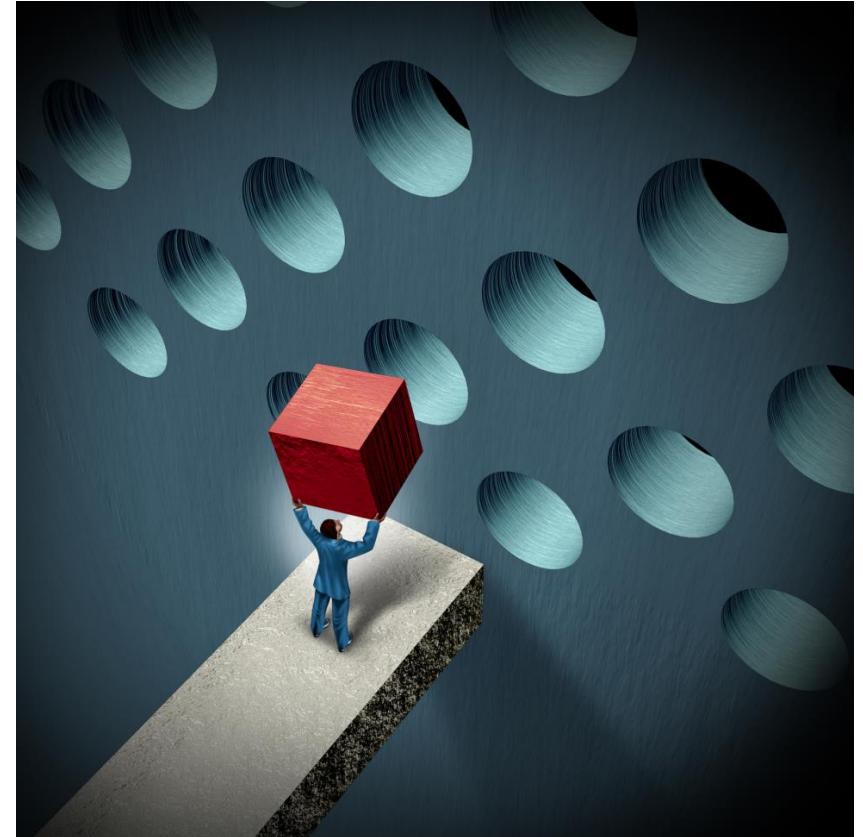

- Anomaly detection
- Forecasting
- Auto-narratives

The screenshot displays a user interface for machine learning insights. On the left, a sidebar lists navigation options: Visualize (selected), Filter, Insights (highlighted with a red box), Story, and Parameters. The main area is titled 'Suggested insights' and includes sections for 'SUM OF REVENUE BY DATE AND GEO' (with a note about detecting anomalies for up to 1 million time series) and 'TOP 3 MOVERS' (listing Australia, Spain, and Japan with their growth rates). Below these are sections for 'GROWTH RATE' (30-day compounded growth rate for total Revenue is 0.28%) and 'DAY OVER DAY CHANGE' (Total Revenue for May 15, 2018 increased by 1.07% from 4,839,243.829 to 4,891,075.3305). At the bottom is a section for 'BOTTOM 2 MOVERS'.

QuickSight Anti-Patterns

- Highly formatted canned reports
 - QuickSight is for ad-hoc queries, analysis, and visualization
- ETL
 - Use Glue instead, although QuickSight can do some transformations

QuickSight Security

- Multi-factor authentication on your account
- VPC connectivity
 - Add QuickSight's IP address range to your database security groups
- Row-level security
- Private VPC access
 - Elastic Network Interface, AWS Direct Connect

QuickSight User Management

- Users defined via IAM, or email signup
- Active Directory integration with QuickSight Enterprise Edition

QuickSight Pricing

- Annual subscription
 - Standard: \$9 / user / month
 - Enterprise: \$18 / user / month
- Extra SPICE capacity (beyond 10GB)
 - \$0.25 (standard) \$0.38 (enterprise) / GB / month
- Month to month
 - Standard: \$12 / GB / month
 - Enterprise: \$24 / GB / month
- Enterprise edition
 - Encryption at rest
 - Microsoft Active Directory integration

QuickSight Dashboards

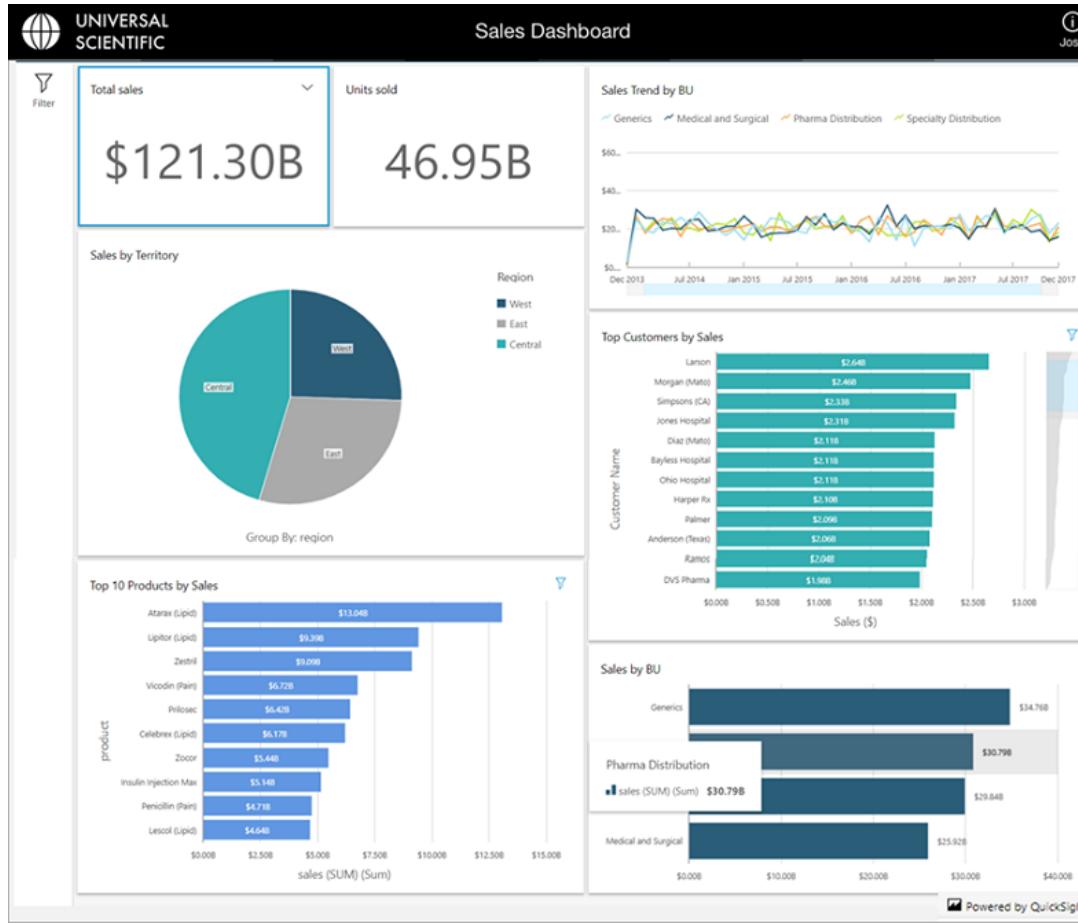

Image: AWS Big Data Blog

QuickSight Visual Types

- AutoGraph
- Bar Charts
 - For comparison and distribution (histograms)
- Line graphs
 - For changes over time
- Scatter plots, heat maps
 - For correlation
- Pie graphs, tree maps
 - For aggregation
- Pivot tables
 - For tabular data
- Stories

EMR

Elastic MapReduce

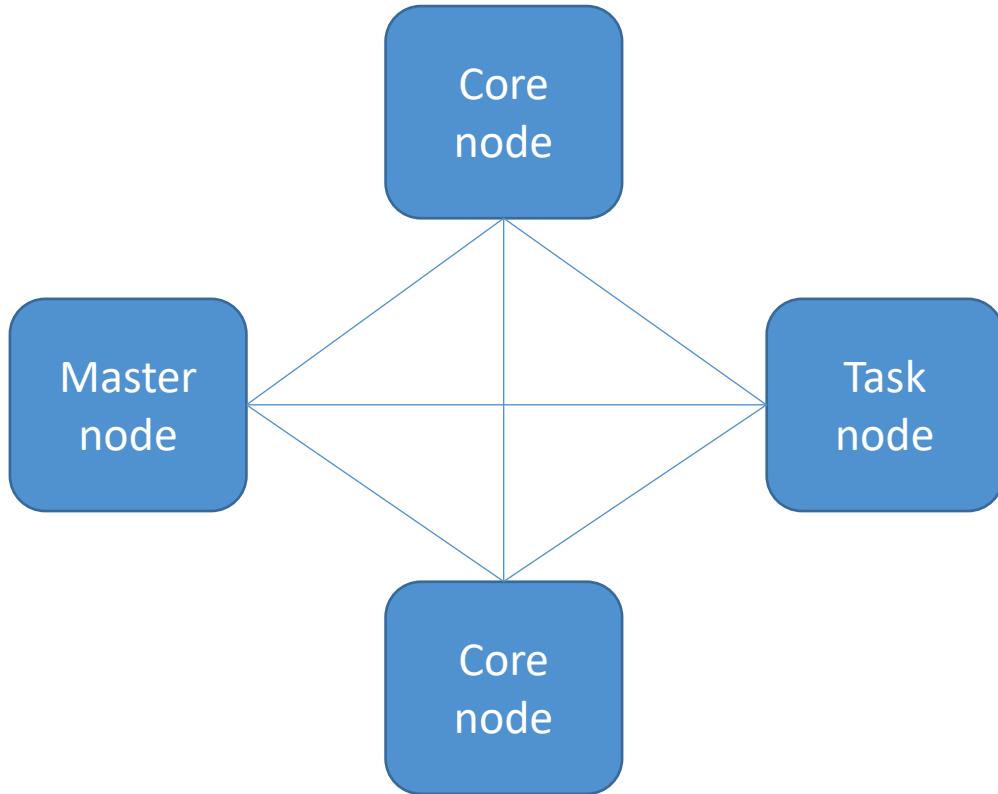

What is EMR?

- Elastic MapReduce
- Managed Hadoop framework on EC2 instances
- Includes Spark, HBase, Presto, Flink, Hive & more
- EMR Notebooks
- Several integration points with AWS

Amazon EMR

An EMR Cluster

- **Master node:** manages the cluster
 - Single EC2 instance
- **Core node:** Hosts HDFS data and runs tasks
 - Can be scaled up & down, but with some risk
- **Task node:** Runs tasks, does not host data
 - No risk of data loss when removing
 - Good use of **spot instances**

EMR Usage

- Transient vs Long-Running Clusters
 - Can spin up task nodes using Spot instances for temporary capacity
 - Can use reserved instances on long-running clusters to save \$
- Connect directly to master to run jobs
- Submit ordered steps via the console

EMR / AWS Integration

- Amazon EC2 for the instances that comprise the nodes in the cluster
- Amazon VPC to configure the virtual network in which you launch your instances
- Amazon S3 to store input and output data
- Amazon CloudWatch to monitor cluster performance and configure alarms
- AWS IAM to configure permissions
- AWS CloudTrail to audit requests made to the service
- AWS Data Pipeline to schedule and start your clusters

EMR Storage

- HDFS
- EMRFS: access S3 as if it were HDFS
 - **EMRFS Consistent View** – Optional for S3 consistency
 - Uses DynamoDB to track consistency
- Local file system
- EBS for HDFS

EMR promises

- EMR charges by the hour
 - Plus EC2 charges
- Provisions new nodes if a core node fails
- Can add and remove tasks nodes on the fly
- Can resize a running cluster's core nodes

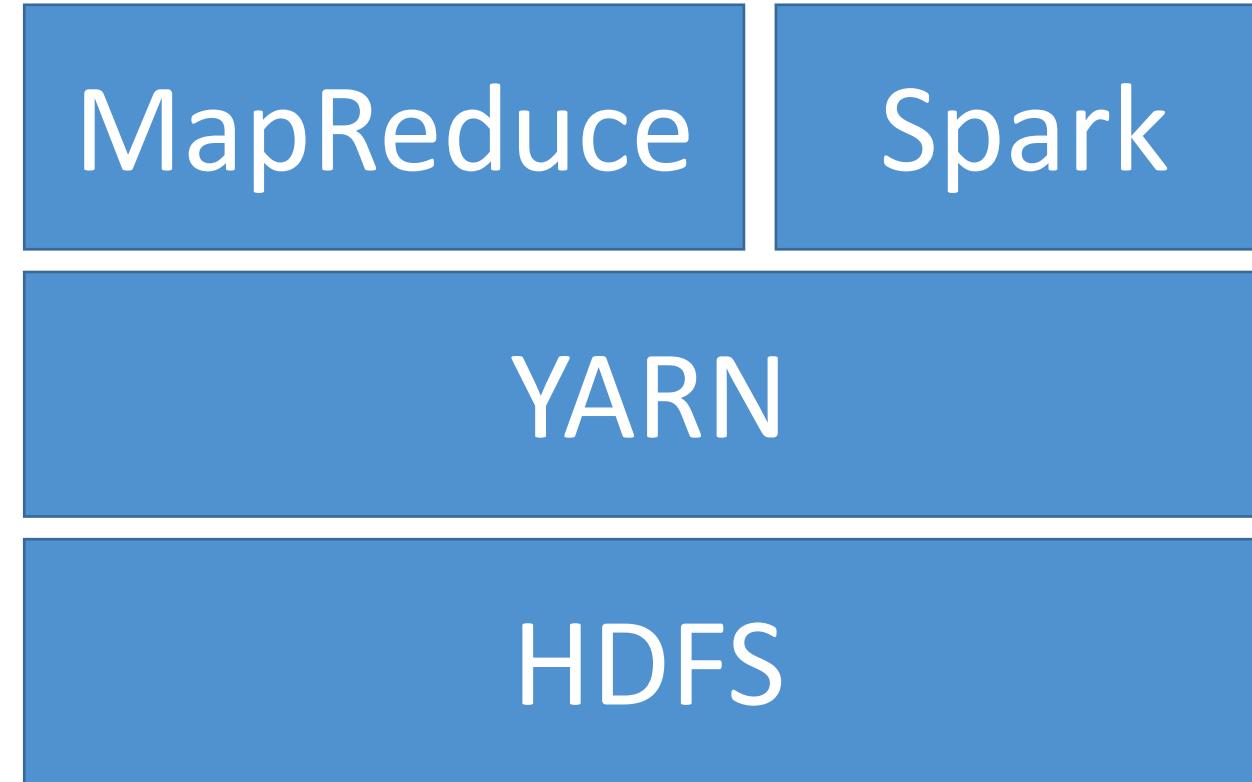

So... what's Hadoop?

MapReduce

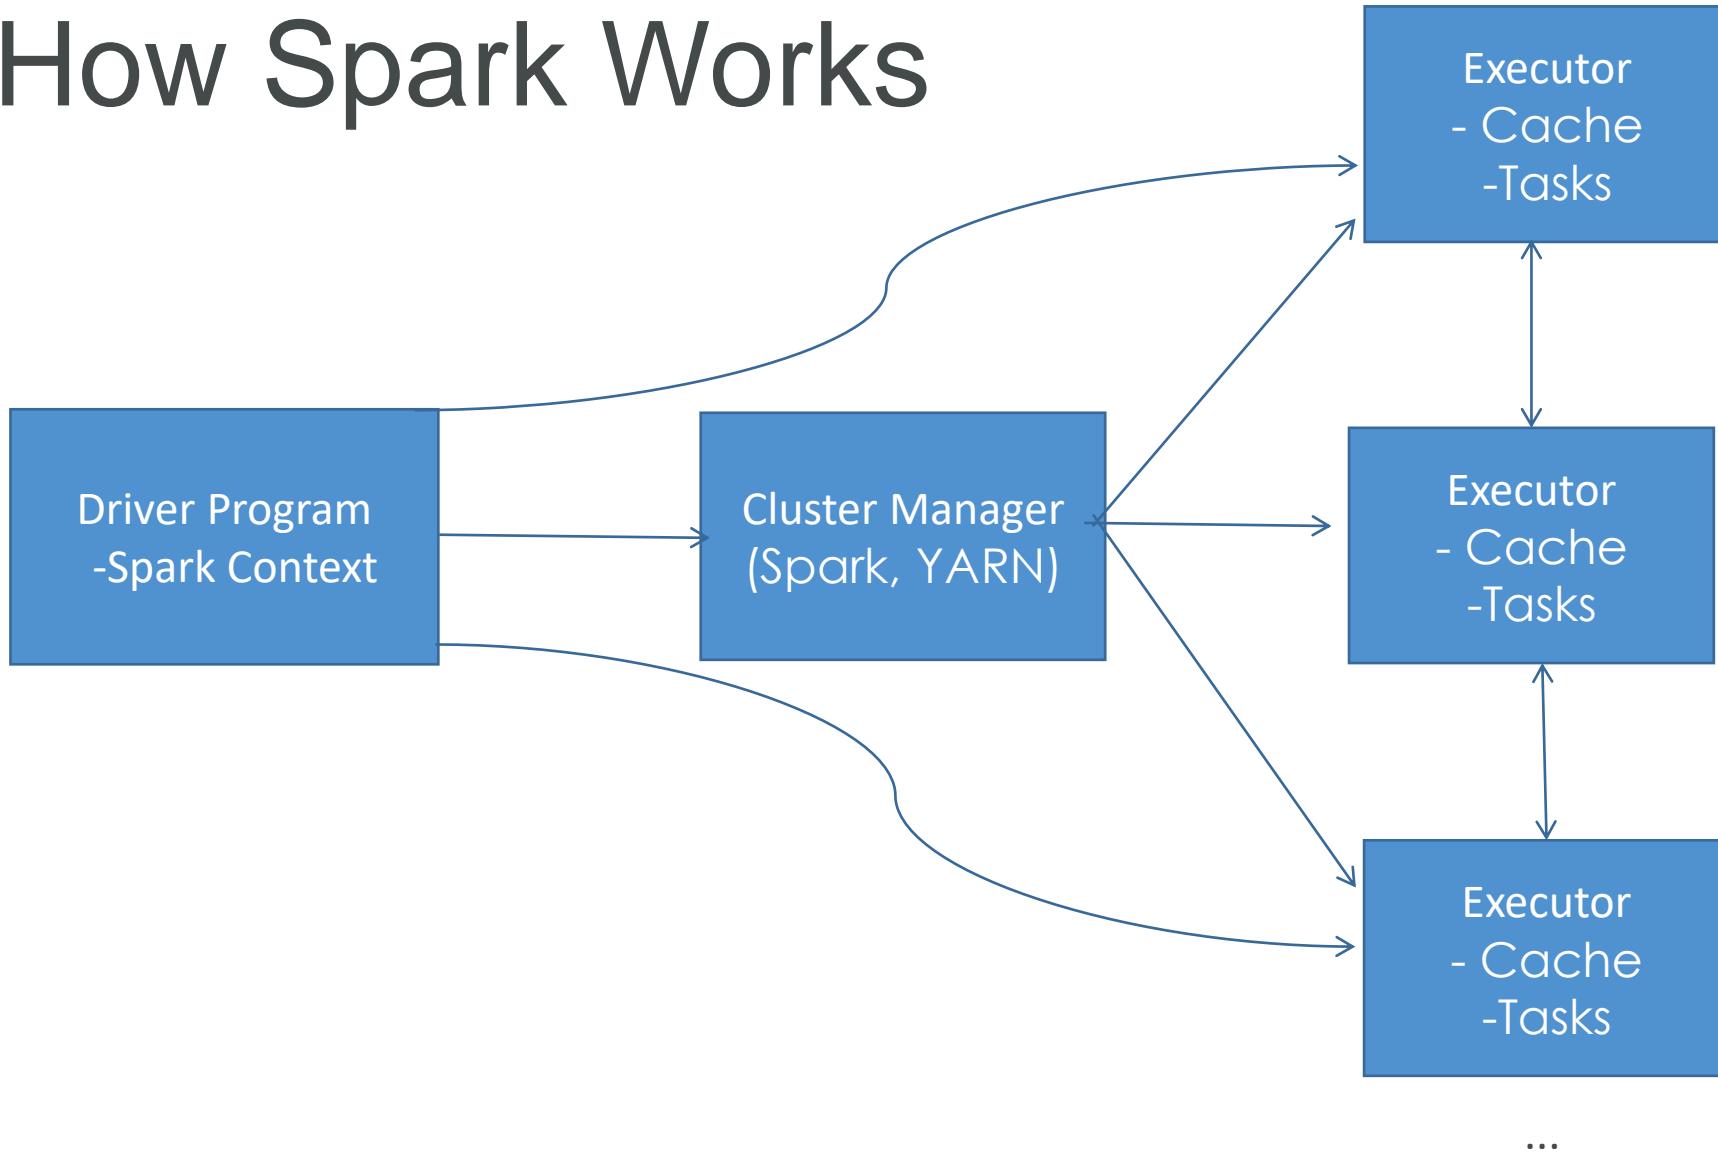

YARN

HDFS

Apache Spark

How Spark Works

Spark Components

Spark Streaming

Spark SQL

MLLib

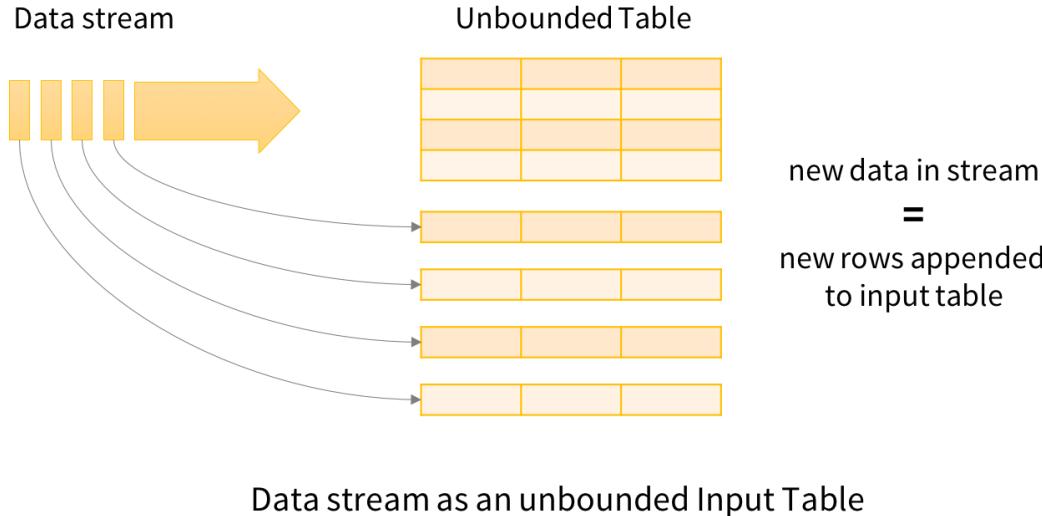

GraphX

SPARK CORE

Spark MLLib

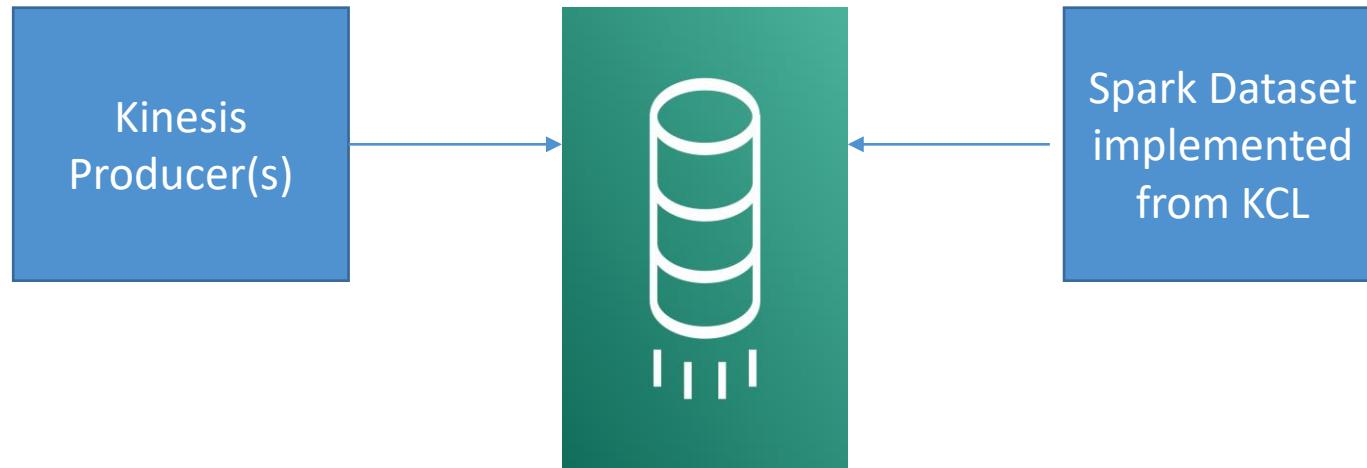

- Classification: logistic regression, naïve Bayes
- Regression
- Decision trees
- Recommendation engine (ALS)
- Clustering (K-Means)
- LDA (topic modeling)
- ML workflow utilities (pipelines, feature transformation, persistence)
- SVD, PCA, statistics

Spark Structured Streaming

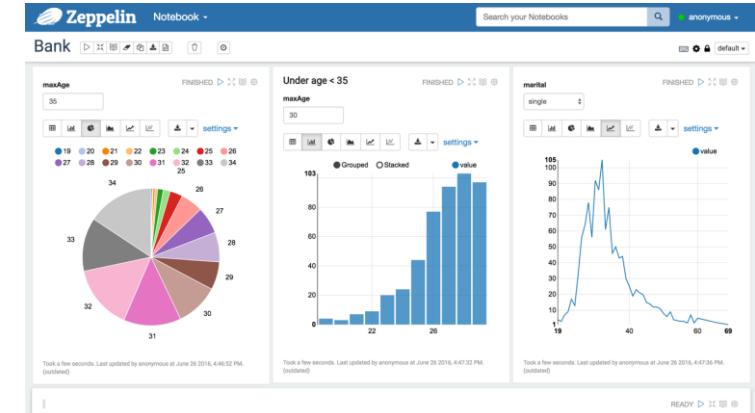

```
val inputDF = spark.readStream.json("s3://logs")
inputDF.groupBy($"action", window($"time", "1 hour")).count()
.writeStream.format("jdbc").start("jdbc:mysql//...")
```

Spark Streaming + Kinesis

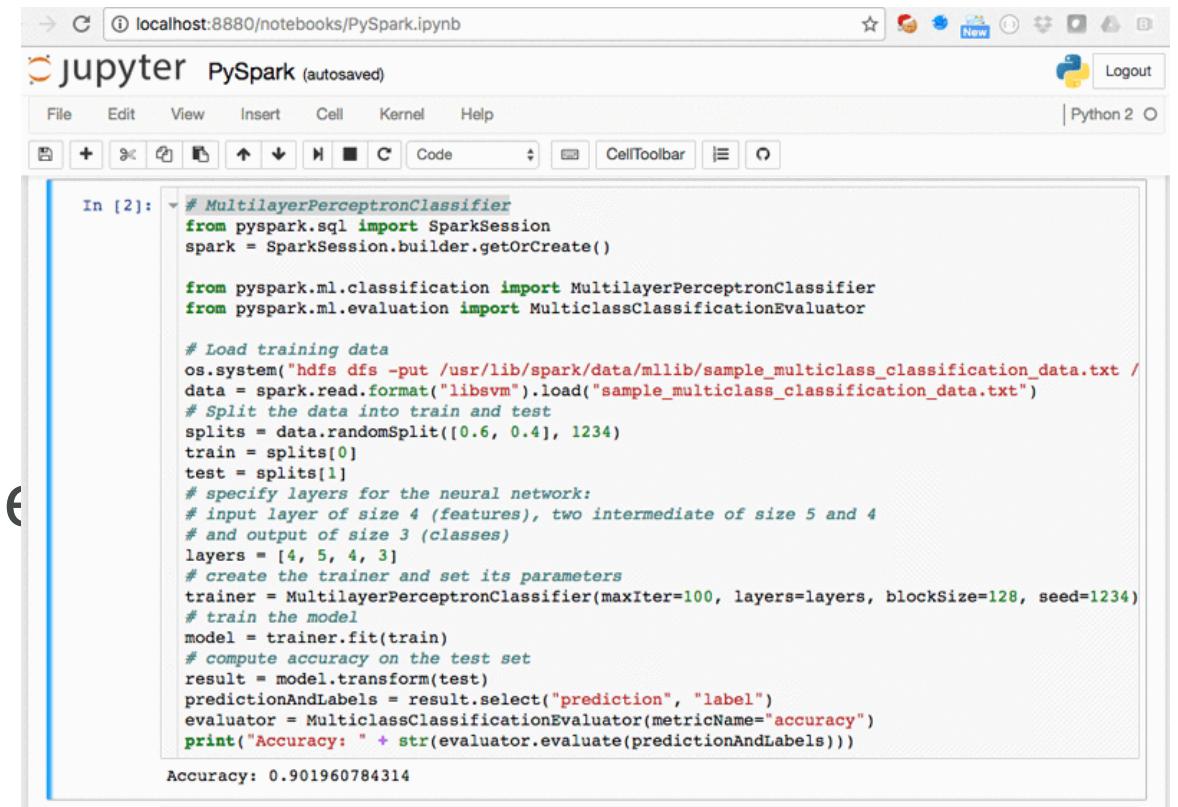

Zeppelin + Spark

- Can run Spark code interactively (like you can in the Spark shell)
 - This speeds up your development cycle
 - And allows easy experimentation and exploration of your big data
- Can execute SQL queries directly against SparkSQL
- Query results may be visualized in charts and graphs
- Makes Spark feel more like a data science tool!

EMR Notebook

- Similar concept to Zeppelin, with more AWS integration
- Notebooks backed up to S3
- Provision clusters from the notebook!
- Hosted inside a VPC
- Accessed only via AWS console

The screenshot shows a Jupyter Notebook interface with the title "PySpark" in the header. The notebook URL is "localhost:8880/notebooks/PySpark.ipynb". The code in cell In [2] is as follows:

```
# MultilayerPerceptronClassifier
from pyspark.sql import SparkSession
spark = SparkSession.builder.getOrCreate()

from pyspark.ml.classification import MultilayerPerceptronClassifier
from pyspark.ml.evaluation import MulticlassClassificationEvaluator

# Load training data
os.system("hdfs dfs -put /usr/lib/spark/data/mllib/sample_multiclass_classification_data.txt /")
data = spark.read.format("libsvm").load("sample_multiclass_classification_data.txt")

# Split the data into train and test
splits = data.randomSplit([0.6, 0.4], 1234)
train = splits[0]
test = splits[1]

# specify layers for the neural network:
# input layer of size 4 (features), two intermediate of size 5 and 4
# and output of size 3 (classes)
layers = [4, 5, 4, 3]

# create the trainer and set its parameters
trainer = MultilayerPerceptronClassifier(maxIter=100, layers=layers, blockSize=128, seed=1234)

# train the model
model = trainer.fit(train)

# compute accuracy on the test set
result = model.transform(test)
predictionAndLabels = result.select("prediction", "label")
evaluator = MulticlassClassificationEvaluator(metricName="accuracy")
print("Accuracy: " + str(evaluator.evaluate(predictionAndLabels)))
```

The output of the code is displayed below the code cell:

Accuracy: 0.901960784314

EMR Security

- IAM policies
- Kerberos
- SSH
- IAM roles

EMR: Choosing Instance Types

- Master node:
 - m4.large if < 50 nodes, m4.xlarge if > 50 nodes
- Core & task nodes:
 - m4.large is usually good
 - If cluster waits a lot on external dependencies (i.e. a web crawler), t2.medium
 - Improved performance: m4.xlarge
 - Computation-intensive applications: high CPU instances
 - Database, memory-caching applications: high memory instances
 - Network / CPU-intensive (NLP, ML) – cluster computer instances
- Spot instances
 - Good choice for task nodes
 - Only use on core & master if you're testing or very cost-sensitive; you're risking partial data loss

Feature Engineering

What is feature engineering?

- Applying your knowledge of the data – and the model you’re using - to create better features to train your model with.
 - Which features should I use?
 - Do I need to transform these features in some way?
 - How do I handle missing data?
 - Should I create new features from the existing ones?
- You can’t just throw in raw data and expect good results
- This is the art of machine learning; where expertise is applied
- “Applied machine learning is basically feature engineering” – Andrew Ng

The Curse of Dimensionality

- Too many features can be a problem – leads to sparse data
- Every feature is a new dimension
- Much of feature engineering is selecting the features most relevant to the problem at hand
 - This often is where domain knowledge comes into play
- Unsupervised dimensionality reduction techniques can also be employed to distill many features into fewer features
 - PCA
 - K-Means

Imputing Missing Data: Mean Replacement

- Replace missing values with the mean value from the rest of the column (columns, not rows! A column represents a single feature; it only makes sense to take the mean from other samples of the same feature.)
- Fast & easy, won't affect mean or sample size of overall data set
- Median may be a better choice than mean when outliers are present
- But it's generally pretty terrible.
 - Only works on column level, misses correlations between features
 - Can't use on categorical features (imputing with most frequent value can work in this case, though)
 - Not very accurate

```
In [3]: import pandas as pd  
  
masses_data = pd.read_csv('mammographic_masses.data.txt',  
masses_data.head()
```

	BI-RADS	age	shape	margin	density	severity
0	5.0	67.0	3.0	5.0	3.0	1
1	4.0	43.0	1.0	1.0	NaN	1
2	5.0	58.0	4.0	5.0	3.0	1
3	4.0	28.0	1.0	1.0	3.0	0
4	5.0	74.0	1.0	5.0	NaN	1

```
In [6]: mean_imputed = masses_data.fillna(masses_data.mean())  
mean_imputed.head()
```

	BI-RADS	age	shape	margin	density	severity
0	5.0	67.0	3.0	5.0	3.000000	1
1	4.0	43.0	1.0	1.0	2.910734	1
2	5.0	58.0	4.0	5.0	3.000000	1
3	4.0	28.0	1.0	1.0	3.000000	0
4	5.0	74.0	1.0	5.0	2.910734	1

Imputing Missing Data: Dropping

- If not many rows contain missing data...
 - ...and dropping those rows doesn't bias your data...
 - ...and you don't have a lot of time...
 - ...maybe it's a reasonable thing to do.
- But, it's never going to be the right answer for the “best” approach.
- Almost anything is better. Can you substitute another similar field perhaps? (i.e., review summary vs. full text)

```
In [3]: import pandas as pd  
  
masses_data = pd.read_csv('mammographic_masses.data')  
masses_data.head()
```

	BI-RADS	age	shape	margin	density	severity
0	5.0	67.0	3.0	5.0	3.0	1
1	4.0	43.0	1.0	1.0	NaN	1
2	5.0	58.0	4.0	5.0	3.0	1
3	4.0	28.0	1.0	1.0	3.0	0
4	5.0	74.0	1.0	5.0	NaN	1

```
In [7]: mean_imputed = masses_data.dropna()  
mean_imputed.head()
```

	BI-RADS	age	shape	margin	density	severity
0	5.0	67.0	3.0	5.0	3.0	1
2	5.0	58.0	4.0	5.0	3.0	1
3	4.0	28.0	1.0	1.0	3.0	0
8	5.0	57.0	1.0	5.0	3.0	1
10	5.0	76.0	1.0	4.0	3.0	1

Imputing Missing Data: Machine Learning

- KNN: Find K “nearest” (most similar) rows and average their values
 - Assumes numerical data, not categorical
 - There are ways to handle categorical data (Hamming distance), but categorical data is probably better served by...
- Deep Learning
 - Build a machine learning model to impute data for your machine learning model!
 - Works well for categorical data. Really well. But it's complicated.
- Regression
 - Find linear or non-linear relationships between the missing feature and other features
 - Most advanced technique: MICE (Multiple Imputation by Chained Equations)

Imputing Missing Data: Just Get More Data

- What's better than imputing data? Getting more real data!
- Sometimes you just have to try harder or collect more data

Handling Unbalanced Data

What is unbalanced data?

- Large discrepancy between “positive” and “negative” cases
 - i.e., fraud detection. Fraud is rare, and most rows will be not-fraud
 - Don’t let the terminology confuse you; “positive” doesn’t mean “good”
 - It means the thing you’re testing for is what happened.
 - If your machine learning model is made to detect fraud, then fraud is the positive case.
- Mainly a problem with neural networks

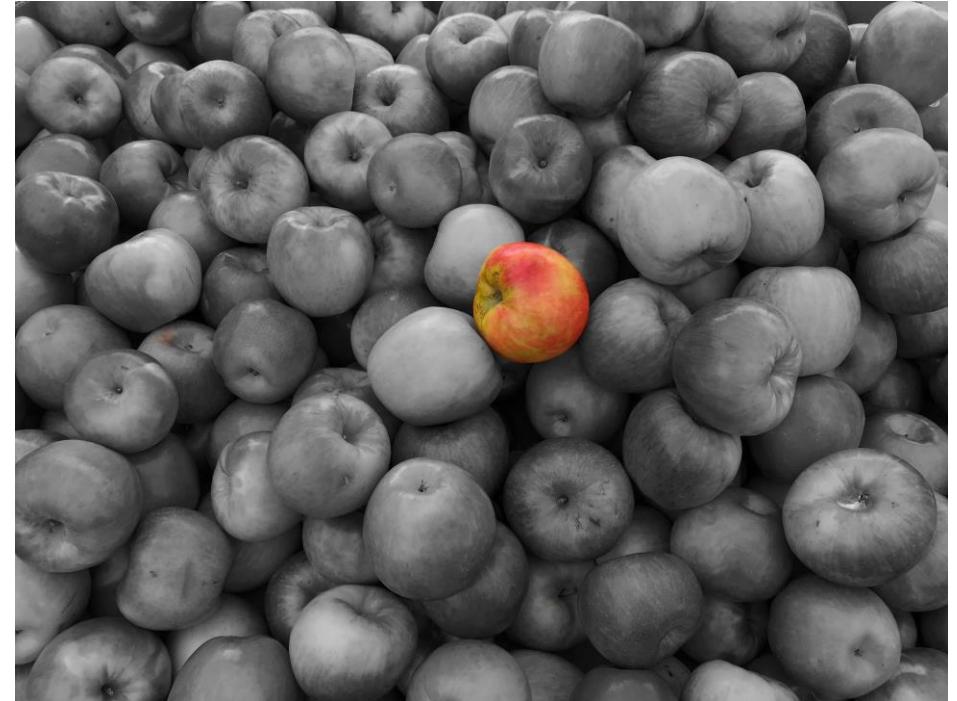

Oversampling

- Duplicate samples from the minority class
- Can be done at random

Undersampling

- Instead of creating more positive samples, remove negative ones
- Throwing data away is usually not the right answer
 - Unless you are specifically trying to avoid “big data” scaling issues

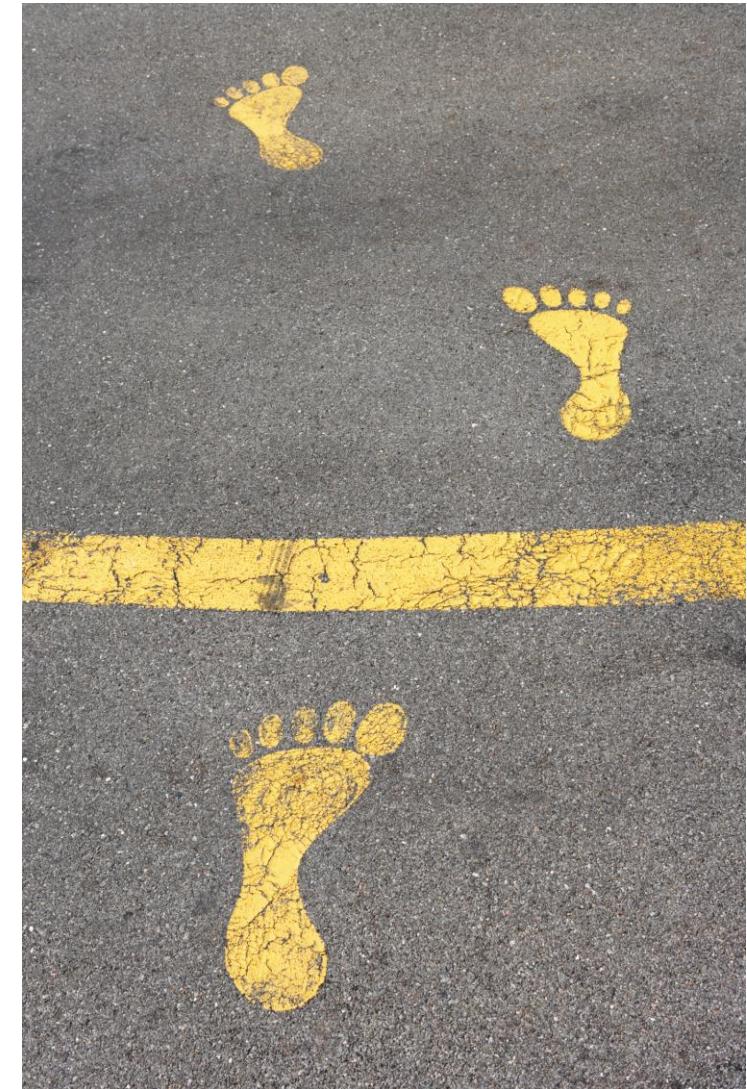

SMOTE

- Synthetic Minority Over-sampling TErchnique
- Artificially generate new samples of the minority class using nearest neighbors
 - Run K-nearest-neighbors of each sample of the minority class
 - Create a new sample from the KNN result (mean of the neighbors)
- Both generates new samples and undersamples majority class
- Generally better than just oversampling

Adjusting thresholds

- When making predictions about a classification (fraud / not fraud), you have some sort of threshold of probability at which point you'll flag something as the positive case (fraud)
- If you have too many false positives, one way to fix that is to simply increase that threshold.
 - Guaranteed to reduce false positives
 - But, could result in more false negatives

Handling Outliers

Variance measures how “spread-out” the data is.

- Variance (σ^2) is simply the **average of the squared differences from the mean**
- Example: What is the variance of the data set (1, 4, 5, 4, 8)?
 - First find the mean: $(1+4+5+4+8)/5 = 4.4$
 - Now find the differences from the mean: (-3.4, -0.4, 0.6, -0.4, 3.6)
 - Find the squared differences: (11.56, 0.16, 0.36, 0.16, 12.96)
 - Find the average of the squared differences:
 - $\sigma^2 = (11.56 + 0.16 + 0.36 + 0.16 + 12.96) / 5 = 5.04$

Standard Deviation σ is just the square root of the variance.

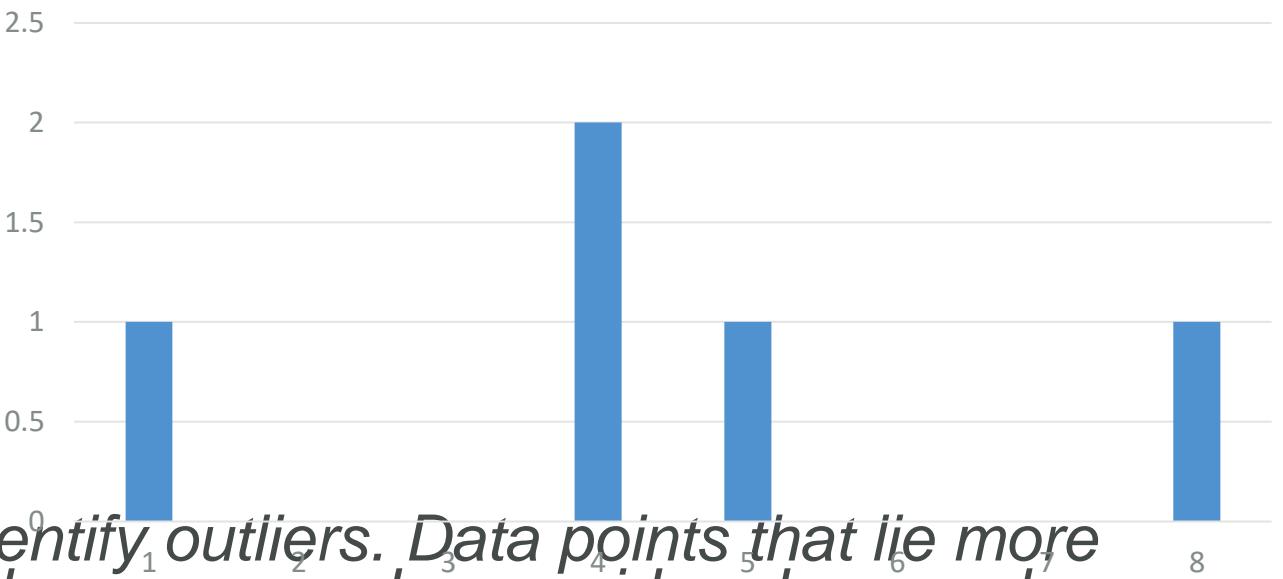

$$\sigma^2 = 5.04$$

$$\sigma = \sqrt{5.04} = 2.24$$

So the standard deviation of (1, 4, 5, 4, 8) is 2.24.

This is usually used as a way to identify outliers. Data points that lie more than one standard deviation from the mean can be considered unusual.

You can talk about how extreme a data point is by talking about “how many sigmas” away from the mean it is.

Dealing with Outliers

- Sometimes it's appropriate to remove outliers from your training data
- Do this responsibly! Understand why you are doing this.
- For example: in collaborative filtering, a single user who rates thousands of movies could have a big effect on everyone else's ratings. That may not be desirable.
- Another example: in web log data, outliers may represent bots or other agents that should be discarded.
- But if someone really wants the mean income of US citizens for example, don't toss out billionaires just because you want to.

Dealing with Outliers

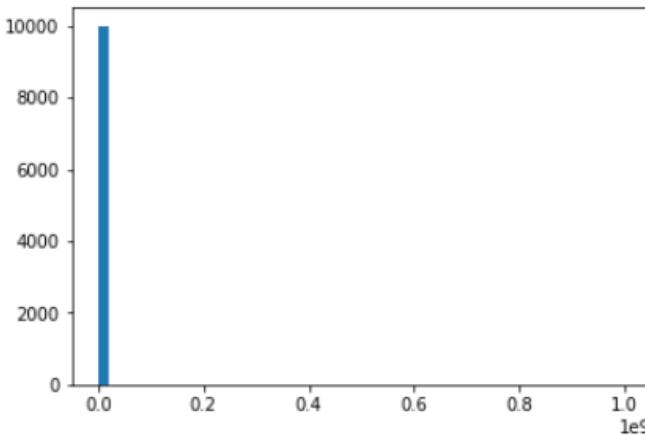

- Our old friend standard deviation provides a principled way to classify outliers.
- Find data points more than some multiple of a standard deviation in your training data.
- What multiple? You just have to use common sense.
- Remember AWS's Random Cut Forest algorithm creeps into many of its services – it is made for outlier detection
 - Found within QuickSight, Kinesis Analytics, SageMaker, and more

Example: Income Inequality

```
: %matplotlib inline
import numpy as np

incomes = np.random.normal(27000, 15000, 10000)
incomes = np.append(incomes, [1000000000])

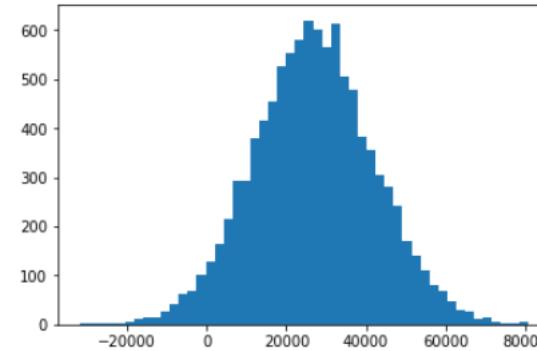

import matplotlib.pyplot as plt
plt.hist(incomes, 50)
plt.show()
```

```
def reject_outliers(data):
    u = np.median(data)
    s = np.std(data)
    filtered = [e for e in data if (u - 2 * s < e < u + 2 * s)]
    return filtered

filtered = reject_outliers(incomes)

plt.hist(filtered, 50)
plt.show()
```

That looks better. And, our mean is more, well, meaningful now as well:

```
np.mean(filtered)
```

```
26894.643431053548
```

Binning

- Bucket observations together based on ranges of values.
- Example: estimated ages of people
 - Put all 20-somethings in one classification, 30-somethings in another, etc.
- Quantile binning categorizes data by their place in the data distribution
 - Ensures even sizes of bins
- Transforms numeric data to ordinal data
- Especially useful when there is uncertainty in the measurements

Transforming

- Applying some function to a feature to make it better suited for training
- Feature data with an exponential trend may benefit from a logarithmic transform
- Example: YouTube recommendations
 - A numeric feature x is also represented by x^2 and \sqrt{x}
 - This allows learning of super and sub-linear functions
- (ref: <https://static.googleusercontent.com/media/research.google.com/en//pubs/archive/45530.pdf>)

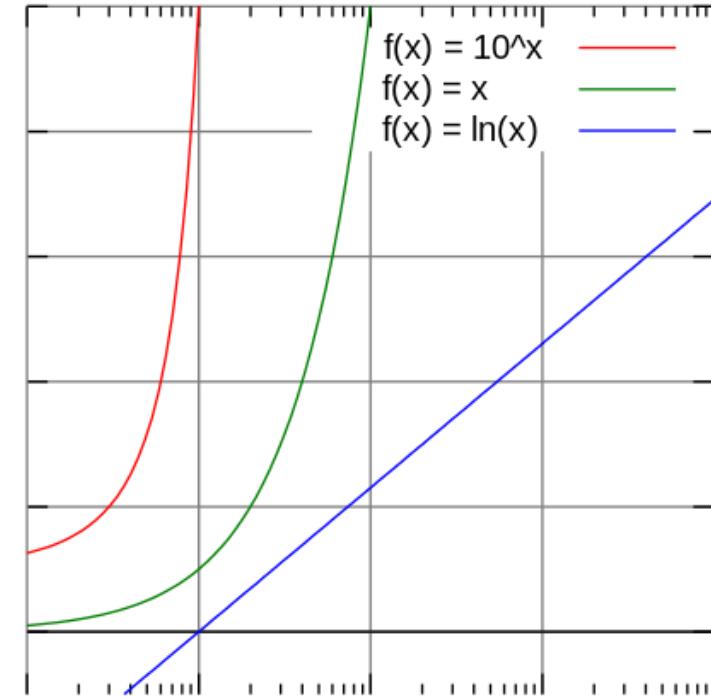

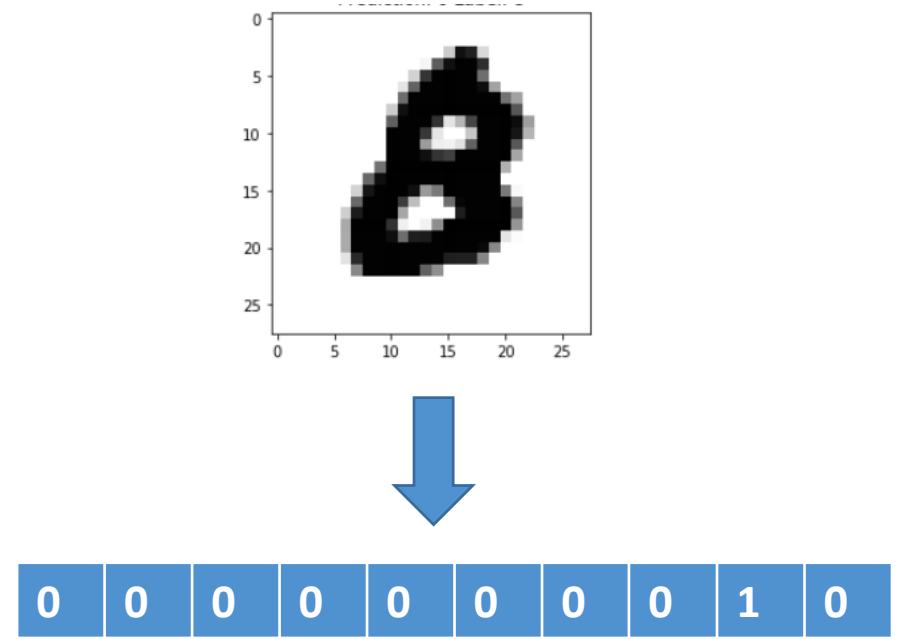

Image: By Autopilot - Own work, CC BY-SA 3.0,
<https://commons.wikimedia.org/w/index.php?curid=10733854>

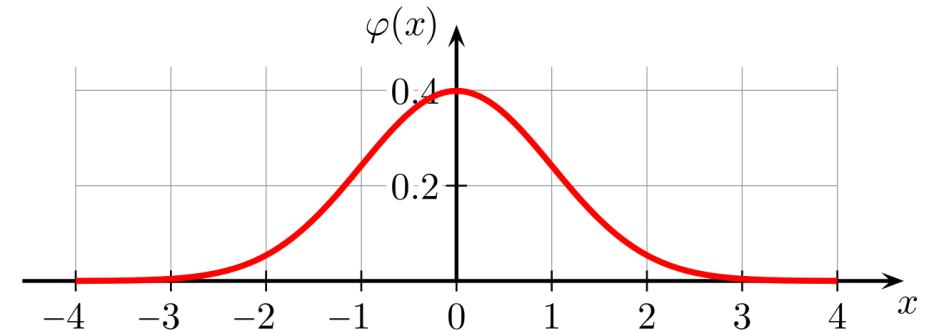

Encoding

- Transforming data into some new representation required by the model
- One-hot encoding
 - Create “buckets” for every category
 - The bucket for your category has a 1, all others have a 0
 - Very common in deep learning, where categories are represented by individual output “neurons”

Scaling / Normalization

- Some models prefer feature data to be normally distributed around 0 (most neural nets)
- Most models require feature data to at least be scaled to comparable values
 - Otherwise features with larger magnitudes will have more weight than they should
 - Example: modeling age and income as features – incomes will be much higher values than ages
- Scikit_learn has a preprocessor module that helps (MinMaxScaler, etc)
- Remember to scale your results back up

Geek3 [CC BY 3.0 (<https://creativecommons.org/licenses/by/3.0>)]

Shuffling

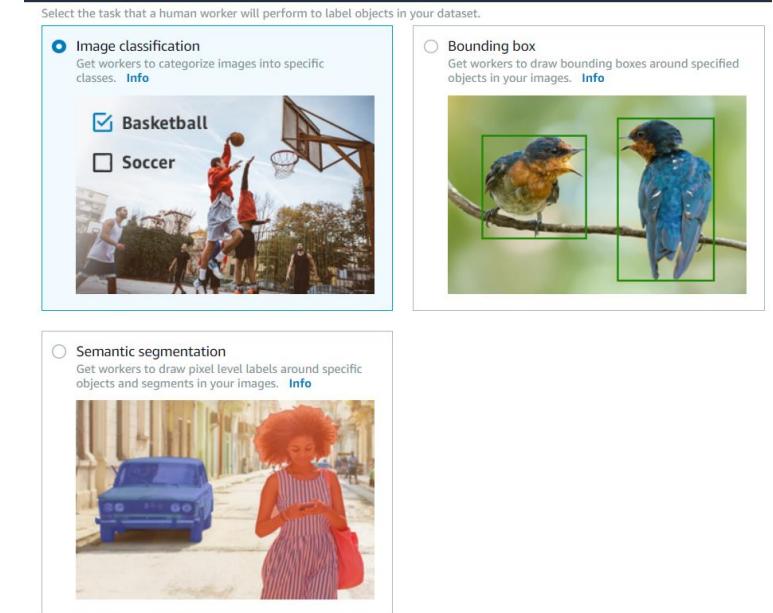

- Many algorithms benefit from shuffling their training data
- Otherwise they may learn from residual signals in the training data resulting from the order in which they were collected

SageMaker Ground Truth

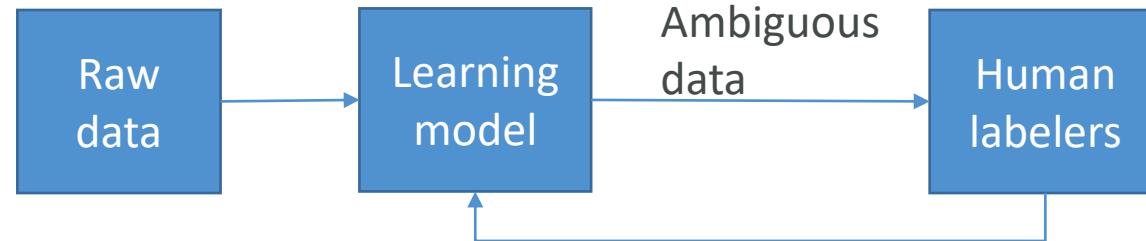

What is Ground Truth?

- Sometimes you don't have training data at all, and it needs to be generated by humans first.
- Example: training an image classification model. Somebody needs to tag a bunch of images with what they are images of before training a neural network
- Ground Truth manages humans who will label your data for training purposes

But it's more than that

- Ground Truth creates its own model as images are labeled by people
- As this model learns, only images the model isn't sure about are sent to human labelers
- This can reduce the cost of labeling jobs by 70%

Who are these human labelers?

- Mechanical Turk
- Your own internal team
- Professional labeling companies

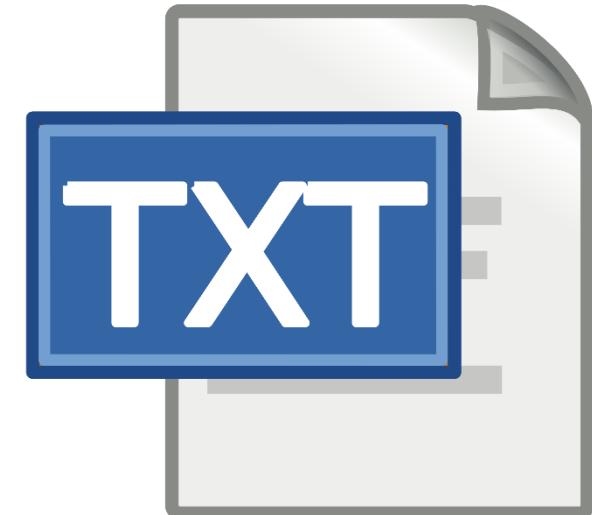

Other ways to generate training labels

- Rekognition
 - AWS service for image recognition
 - Automatically classify images
- Comprehend
 - AWS service for text analysis and topic modeling
 - Automatically classify text by topics, sentiment
- Any pre-trained model or unsupervised technique that may be helpful

Lab: Preparing Data for TF-IDF on Spark and EMR

TF-IDF

- Stands for *Term Frequency* and *Inverse Document Frequency*
- Important data for search – figures out what terms are most relevant for a document
- Sounds fancy!

TF-IDF Explained

- *Term Frequency* just measures how often a word occurs in a document
 - A word that occurs frequently is probably important to that document's meaning
- *Document Frequency* is how often a word occurs in an entire set of documents, i.e., all of Wikipedia or every web page
 - This tells us about common words that just appear everywhere no matter what the topic, like “a”, “the”, “and”, etc.

TF-IDF Explained

- So a measure of the relevancy of a word to a document might be:

$$\frac{\text{Term Frequency}}{\text{Document Frequency}}$$

Or: Term Frequency * Inverse Document Frequency

That is, take how often the word appears in a document, over how often it just appears everywhere. That gives you a measure of how important and unique this word is for this document

TF-IDF In Practice

- We actually use the log of the IDF, since word frequencies are distributed exponentially. That gives us a better weighting of a words overall popularity
- TF-IDF assumes a document is just a “bag of words”
 - Parsing documents into a bag of words can be most of the work
 - Words can be represented as a hash value (number) for efficiency
 - What about synonyms? Various tenses? Abbreviations? Capitalizations? Misspellings?
- Doing this at scale is the hard part
 - That's where Spark comes in!

Unigrams, bigrams, etc.

- An extension of TF-IDF is to not only compute relevancy for individual words (terms) but also for *bi-grams* or, more generally, *n-grams*.
- “I love certification exams”
 - Unigrams: “I”, “love”, “certification”, “exams”
 - Bi-grams: “I love”, “love certification”, “certification exams”
 - Tri-grams: “I love certification”, “love certification exams”

Sample TF-IDF matrix with unigrams and bigrams

	I	Love	Certification	Exams	Puppies	I love	Love certification	Love puppies	Certification exams
"I love certification exams"									
"I love puppies"									

Using TF-IDF

- A very simple search algorithm could be:
 - Compute TF-IDF for every word in a corpus
 - For a given search word, sort the documents by their TF-IDF score for that word
 - Display the results

Let's use TF-IDF on Wikipedia

WIKIPEDIA

Deep Learning 101

And AWS Best Practices

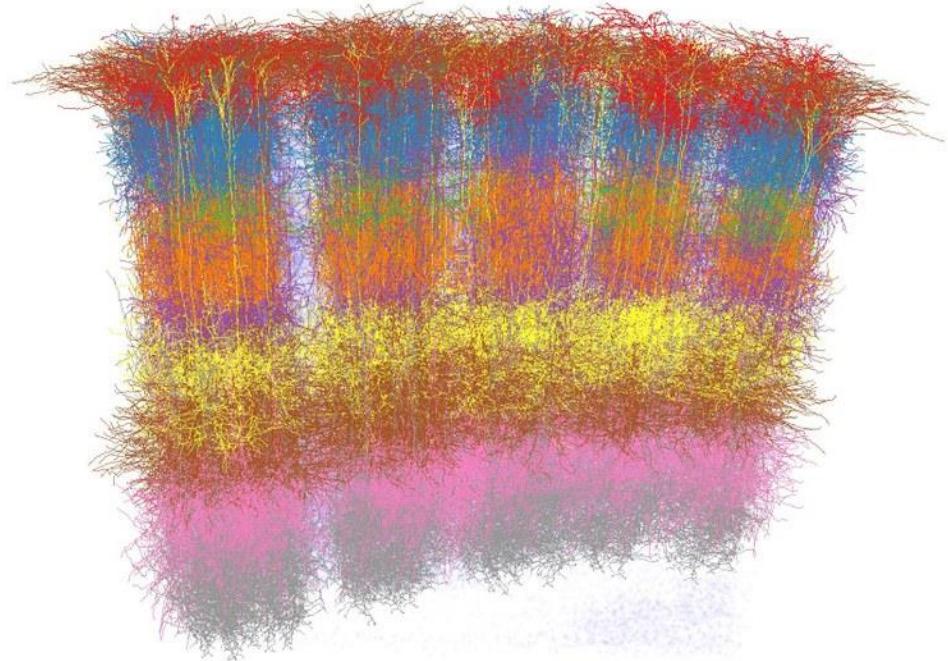

The biological inspiration

- Neurons in your cerebral cortex are connected via axons
- A neuron “fires” to the neurons it’s connected to, when enough of its input signals are activated.
- Very simple at the individual neuron level – but layers of neurons connected in this way can yield learning behavior.
- Billions of neurons, each with thousands of connections, yields a mind

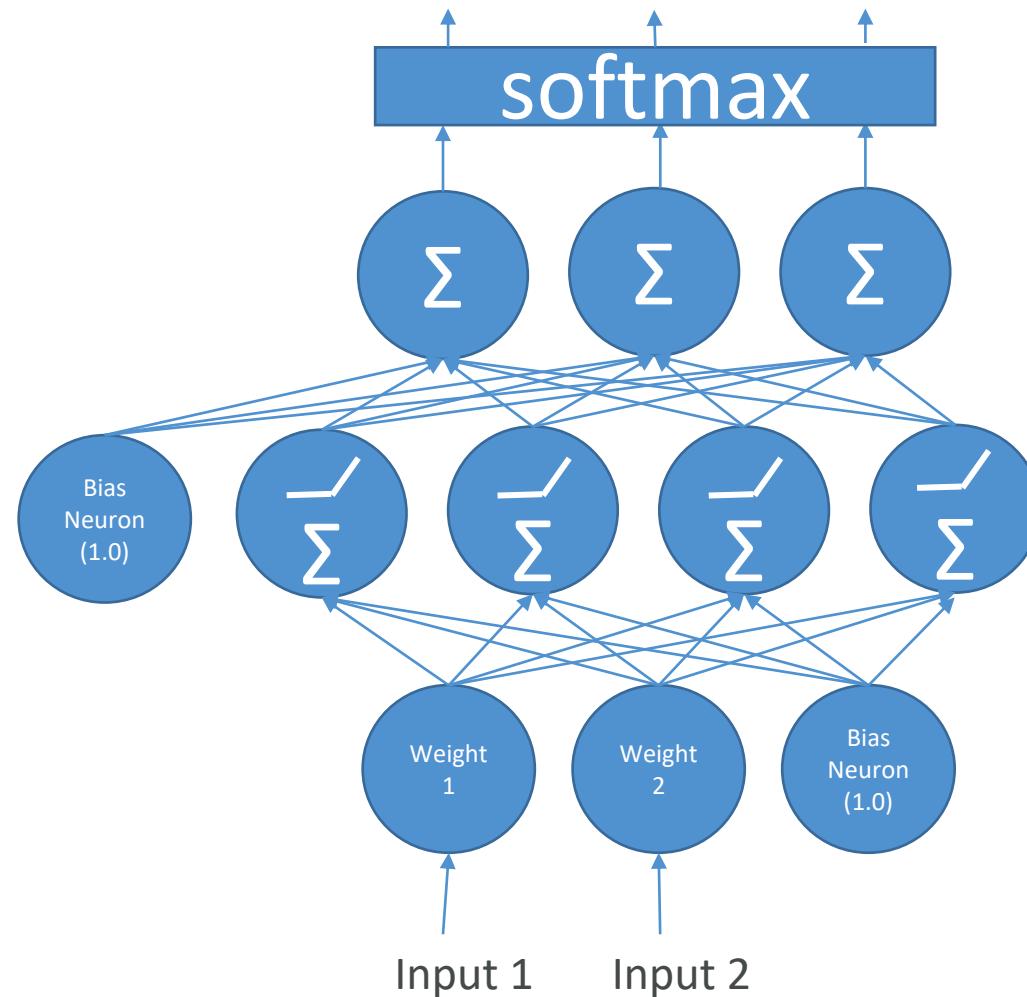

Cortical columns

- Neurons in your cortex seem to be arranged into many stacks, or “columns” that process information in parallel
- “mini-columns” of around 100 neurons are organized into larger “hyper-columns”. There are 100 million mini-columns in your cortex
- This is coincidentally similar to how GPU’s work...

(credit: Marcel Oberlaender et al.)

Deep Neural Networks

Deep Learning Frameworks

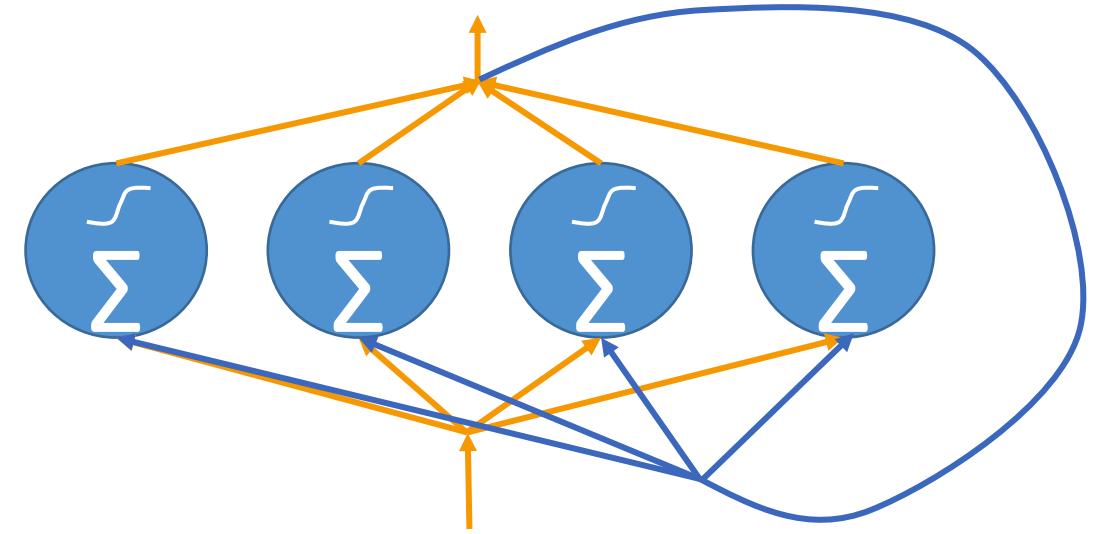

- Tensorflow / Keras
- MXNet

```
model = Sequential()

model.add(Dense(64, activation='relu', input_dim=20))
model.add(Dropout(0.5))
model.add(Dense(64, activation='relu'))
model.add(Dropout(0.5))
model.add(Dense(10, activation='softmax'))
sgd = SGD(lr=0.01, decay=1e-6, momentum=0.9,
           nesterov=True)
model.compile(loss='categorical_crossentropy',
              optimizer=sgd, metrics=['accuracy'])
```

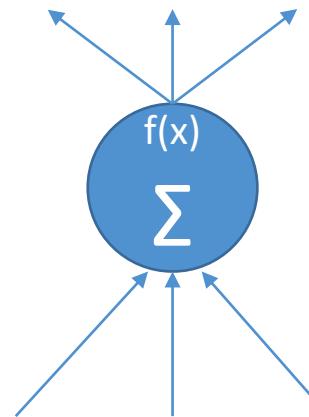

Types of Neural Networks

- Feedforward Neural Network
- Convolutional Neural Networks (CNN)
 - Image classification (is there a stop sign in this image?)
- Recurrent Neural Networks (RNNs)
 - Deals with sequences in time (predict stock prices, understand words in a sentence, translation, etc)
 - **LSTM**, GRU

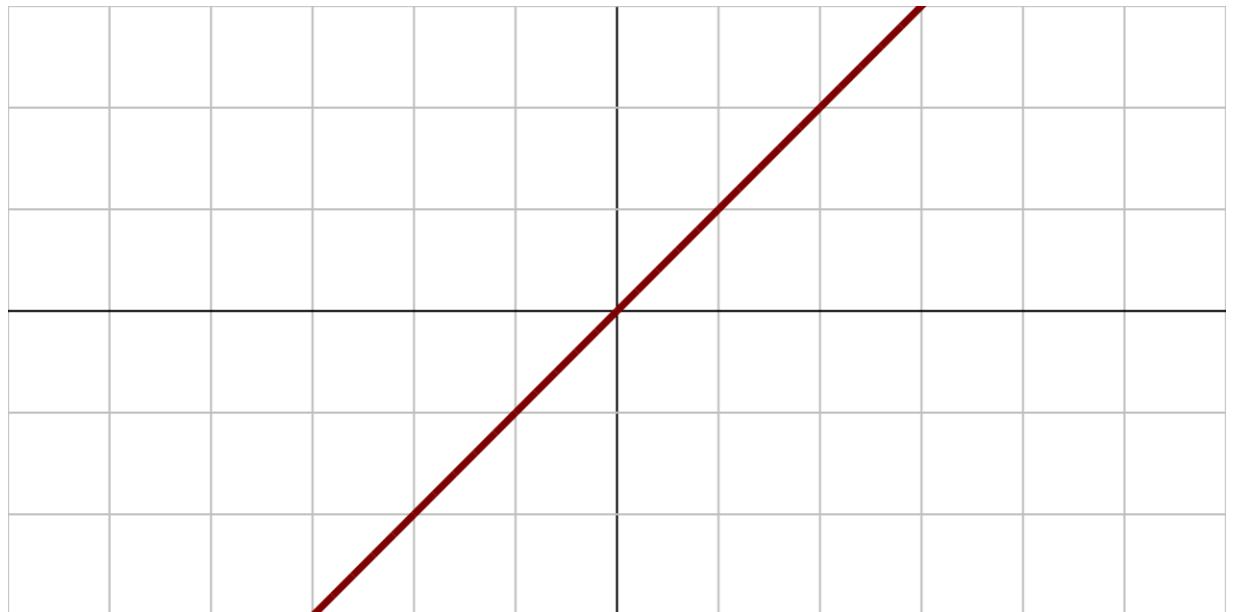

Activation Functions

- Define the output of a node / neuron given its input signals

Linear activation function

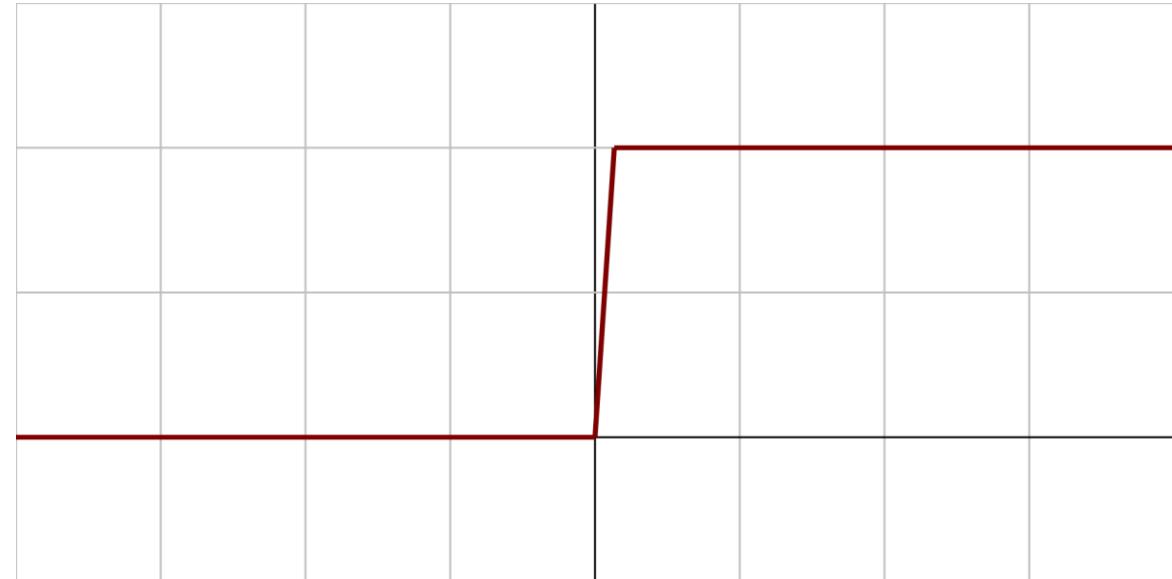

- It doesn't really *do* anything
- Can't do backpropagation

By Laughsinthestocks - Own work, CC BY-SA 4.0, <https://commons.wikimedia.org/w/index.php?curid=44920411>

Binary step function

- It's on or off
- Can't handle multiple classification – it's binary after all
- Vertical slopes don't work well with calculus!

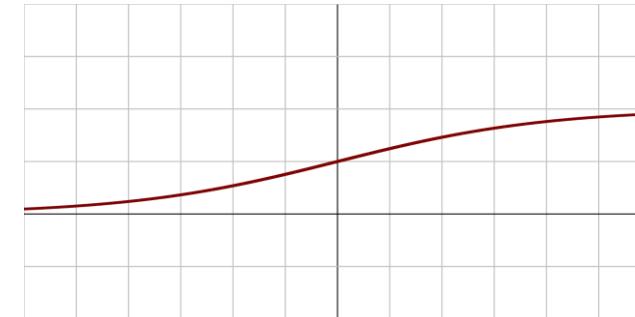

By Laughsinthestocks - Own work, CC BY-SA 4.0, <https://commons.wikimedia.org/w/index.php?curid=44920435>

Instead we need non-linear activation functions

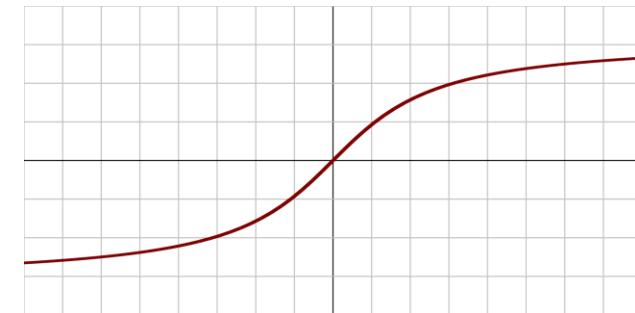

- These can create complex mappings between inputs and outputs
- Allow backpropagation (because they have a useful derivative)
- Allow for multiple layers (linear functions degenerate to a single layer)

Sigmoid / Logistic / TanH

- Nice & smooth
- Scales everything from 0-1 (Sigmoid / Logistic) or -1 to 1 (tanh / hyperbolic tangent)
- But: changes slowly for high or low values
 - The “Vanishing Gradient” problem
- Computationally expensive
- Tanh generally preferred over sigmoid

Sigmoid AKA Logistic

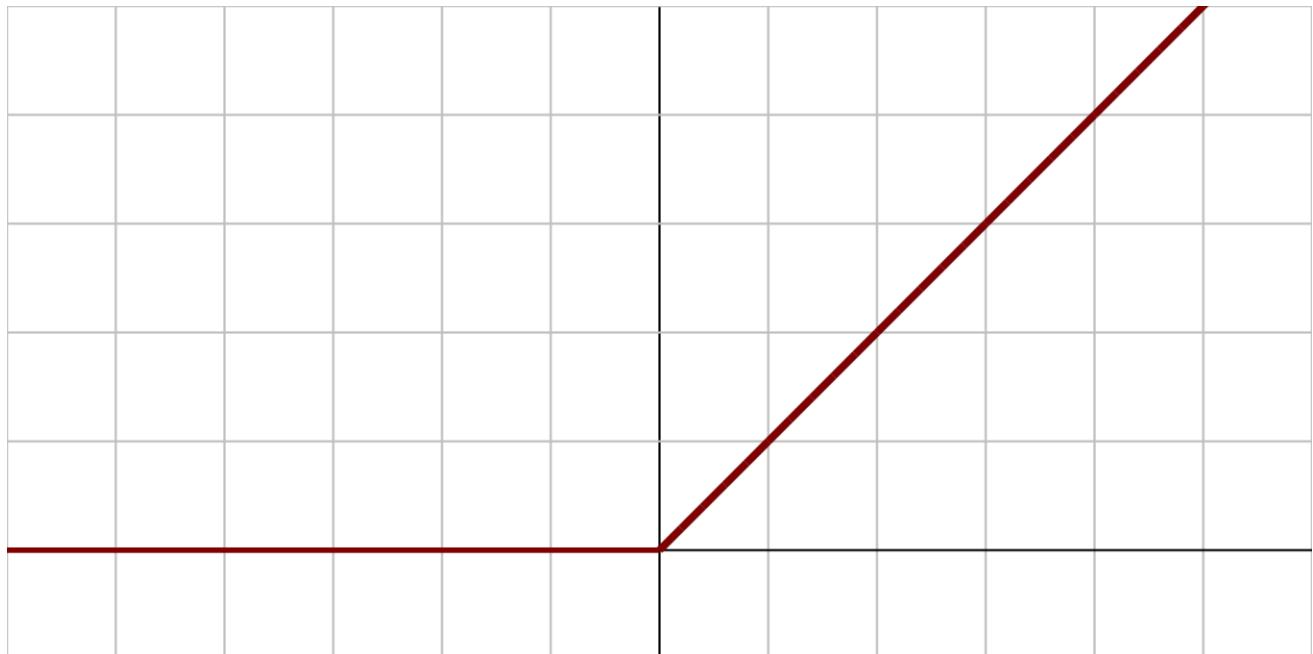

TanH AKA Hyperbolic Tangent

By Laughsinthestocks - Own work, CC BY-SA 4.0, <https://commons.wikimedia.org/w/index.php?curid=44920533>

Rectified Linear Unit (ReLU)

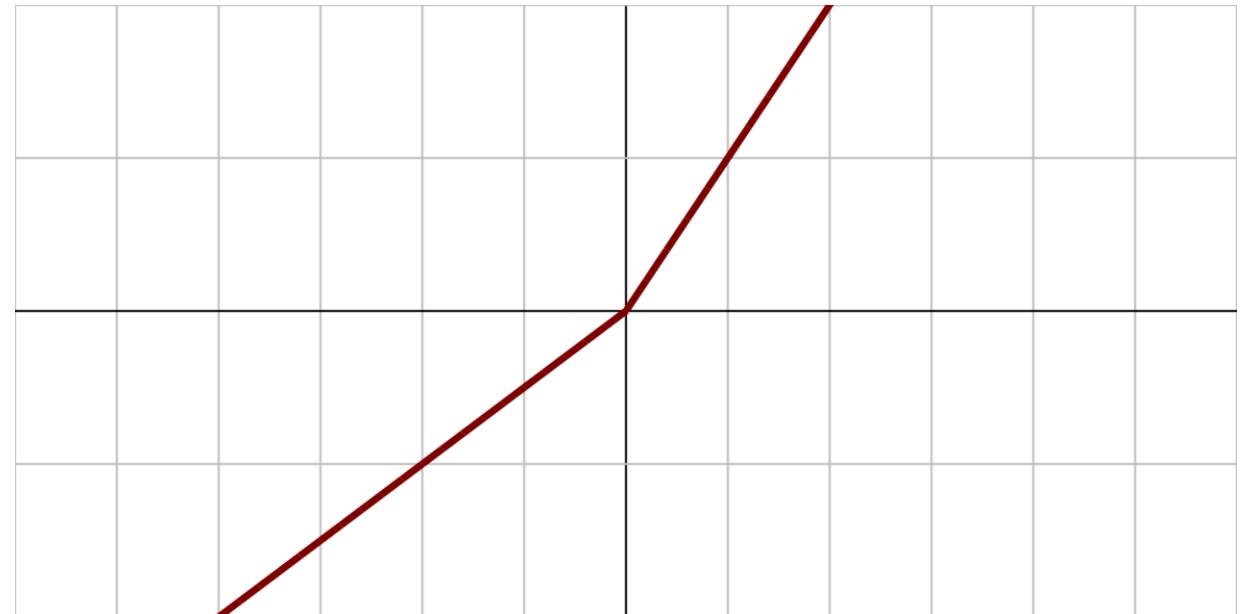

- Now we're talking
- Very popular choice
- Easy & fast to compute
- But, when inputs are zero or negative, we have a linear function and all of its problems
 - The “Dying ReLU problem”

By Laughsinhestocks - Own work, CC BY-SA 4.0, <https://commons.wikimedia.org/w/index.php?curid=44920600>

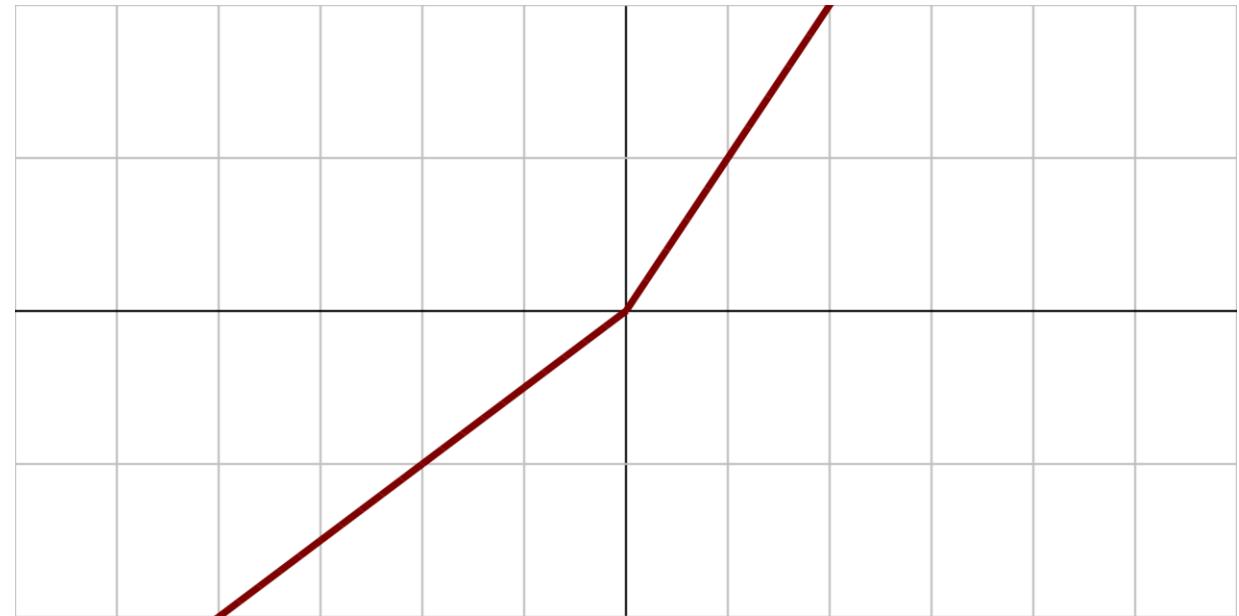

Leaky ReLU

- Solves “dying ReLU” by introducing a negative slope below 0 (usually not as steep as this)

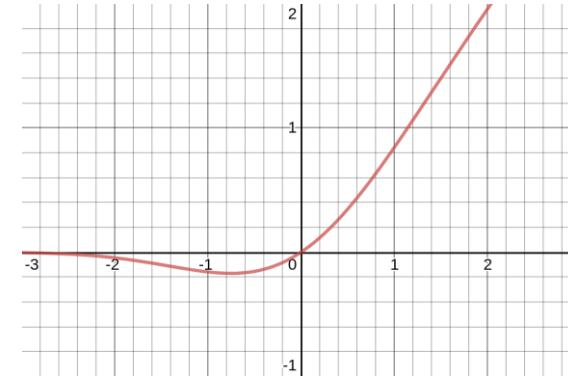

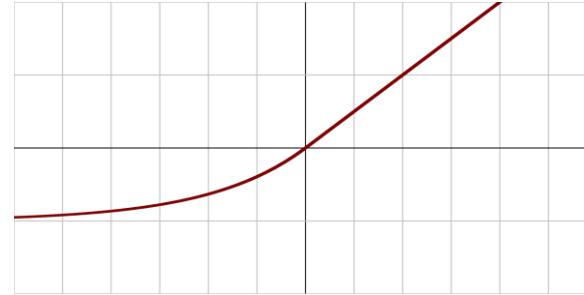

Parametric ReLU (PReLU)

- ReLU, but the slope in the negative part is learned via backpropagation
- Complicated and YMMV

Other ReLU variants

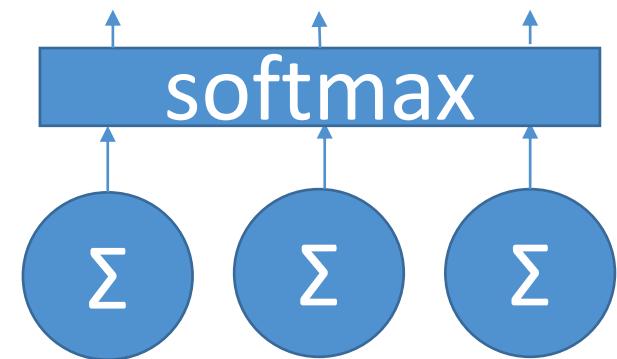

- Exponential Linear Unit (ELU)
- Swish
 - From Google, performs really well
 - But it's from Google, not Amazon...
 - Mostly a benefit with very deep networks (40+ layers)
- Maxout
 - Outputs the max of the inputs
 - Technically ReLU is a special case of maxout
 - But doubles parameters that need to be trained, not often practical.

By Ringdongling - Own work, CC BY-SA 4.0, <https://commons.wikimedia.org/w/index.php?curid=85402414>

Softmax

- Used on the final output layer of a multiple classification problem
- Basically converts outputs to probabilities of each classification
- Can't produce more than one label for something (sigmoid can)
- Don't worry about the actual function for the exam, just know what it's used for.

Choosing an activation function

- For multiple classification, use softmax on the output layer
- RNN's do well with Tanh
- For everything else
 - Start with ReLU
 - If you need to do better, try Leaky ReLU
 - Last resort: PReLU, Maxout
 - Swish for really deep networks

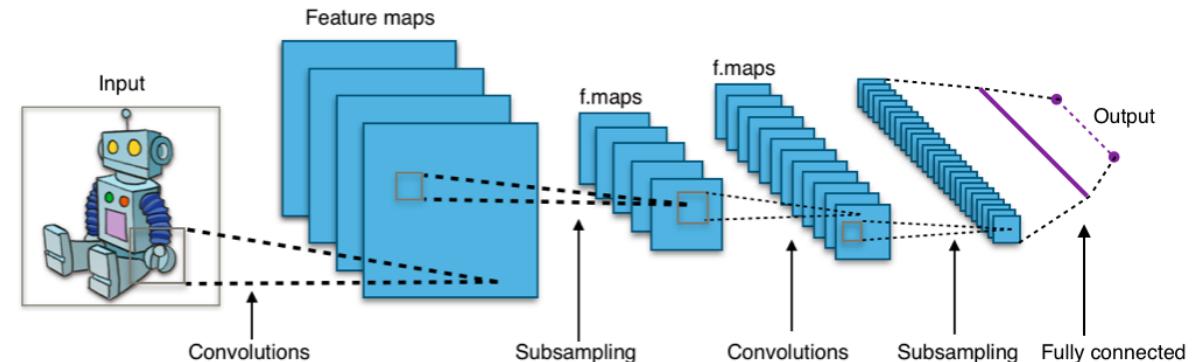

CNN's: what are they for?

- When you have data that doesn't neatly align into columns
 - Images that you want to find features within
 - Machine translation
 - Sentence classification
 - Sentiment analysis
- They can find features that aren't in a specific spot
 - Like a stop sign in a picture
 - Or words within a sentence
- They are “feature-location invariant”

CNN's: how do they work?

- Inspired by the biology of the visual cortex
 - Local receptive fields are groups of neurons that only respond to a part of what your eyes see (subsampling)
 - They overlap each other to cover the entire visual field (convolutions)
 - They feed into higher layers that identify increasingly complex images
 - Some receptive fields identify horizontal lines, lines at different angles, etc. (filters)
 - These would feed into a layer that identifies shapes
 - Which might feed into a layer that identifies objects
 - For color images, extra layers for red, green, and blue

How do we “know” that’s a stop sign?

- Individual local receptive fields scan the image looking for edges, and pick up the edges of the stop sign in a layer
- Those edges in turn get picked up by a higher level convolution that identifies the stop sign’s shape (and letters, too)
- This shape then gets matched against your pattern of what a stop sign looks like, also using the strong red signal coming from your red layers
- That information keeps getting processed upward until your foot hits the brake!
- A CNN works the same way

CNN's with Keras / Tensorflow

- Source data must be of appropriate dimensions
 - ie width x length x color channels
- Conv2D layer type does the actual convolution on a 2D image
 - Conv1D and Conv3D also available – doesn't have to be image data
- MaxPooling2D layers can be used to reduce a 2D layer down by taking the maximum value in a given block
- Flatten layers will convert the 2D layer to a 1D layer for passing into a flat hidden layer of neurons
- Typical usage:
 - Conv2D -> MaxPooling2D -> Dropout -> Flatten -> Dense -> Dropout -> Softmax

CNN's are hard

- Very resource-intensive (CPU, GPU, and RAM)
- Lots of hyperparameters
 - Kernel sizes, many layers with different numbers of units, amount of pooling... in addition to the usual stuff like number of layers, choice of optimizer
- Getting the training data is often the hardest part! (As well as storing and accessing it)

Specialized CNN architectures

- Defines specific arrangement of layers, padding, and hyperparameters
- LeNet-5
 - Good for handwriting recognition
- AlexNet
 - Image classification, deeper than LeNet
- GoogLeNet
 - Even deeper, but with better performance
 - Introduces *inception modules* (groups of convolution layers)
- ResNet (Residual Network)
 - Even deeper – maintains performance via *skip connections*.

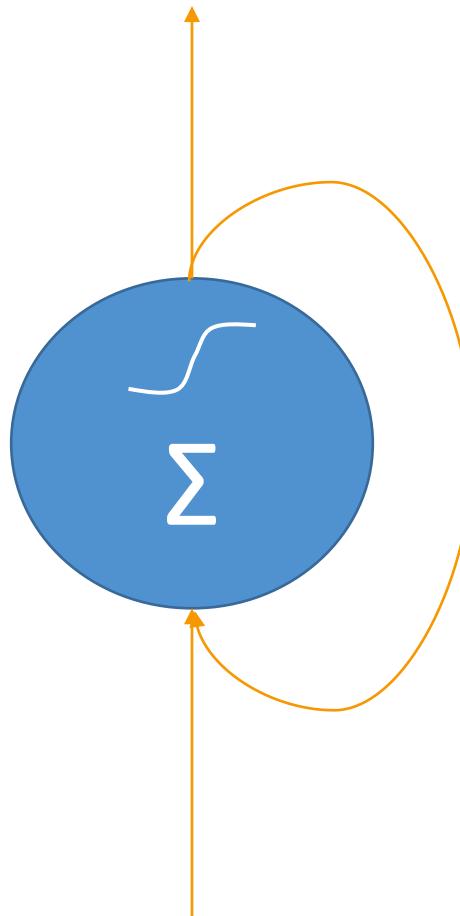

Recurrent Neural Networks

RNN's: what are they for?

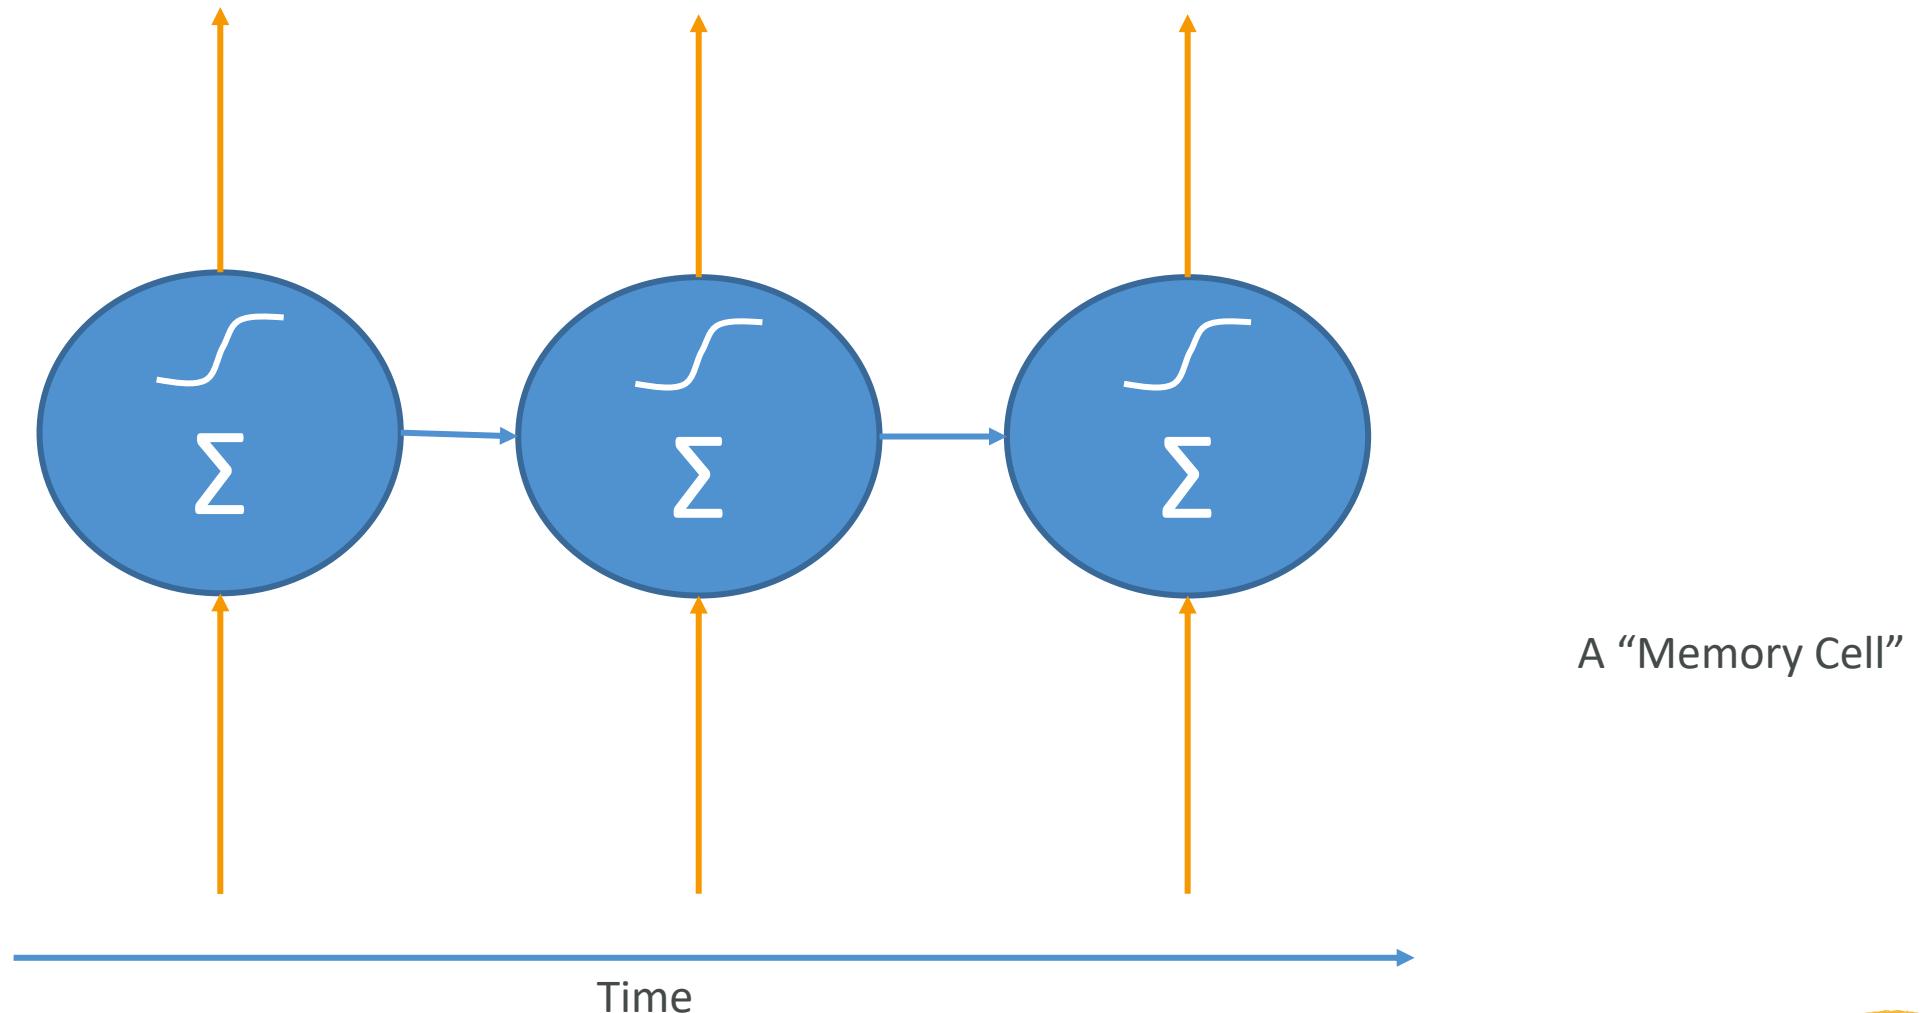

- Time-series data
 - When you want to predict future behavior based on past behavior
 - Web logs, sensor logs, stock trades
 - Where to drive your self-driving car based on past trajectories
- Data that consists of sequences of arbitrary length
 - Machine translation
 - Image captions
 - Machine-generated music

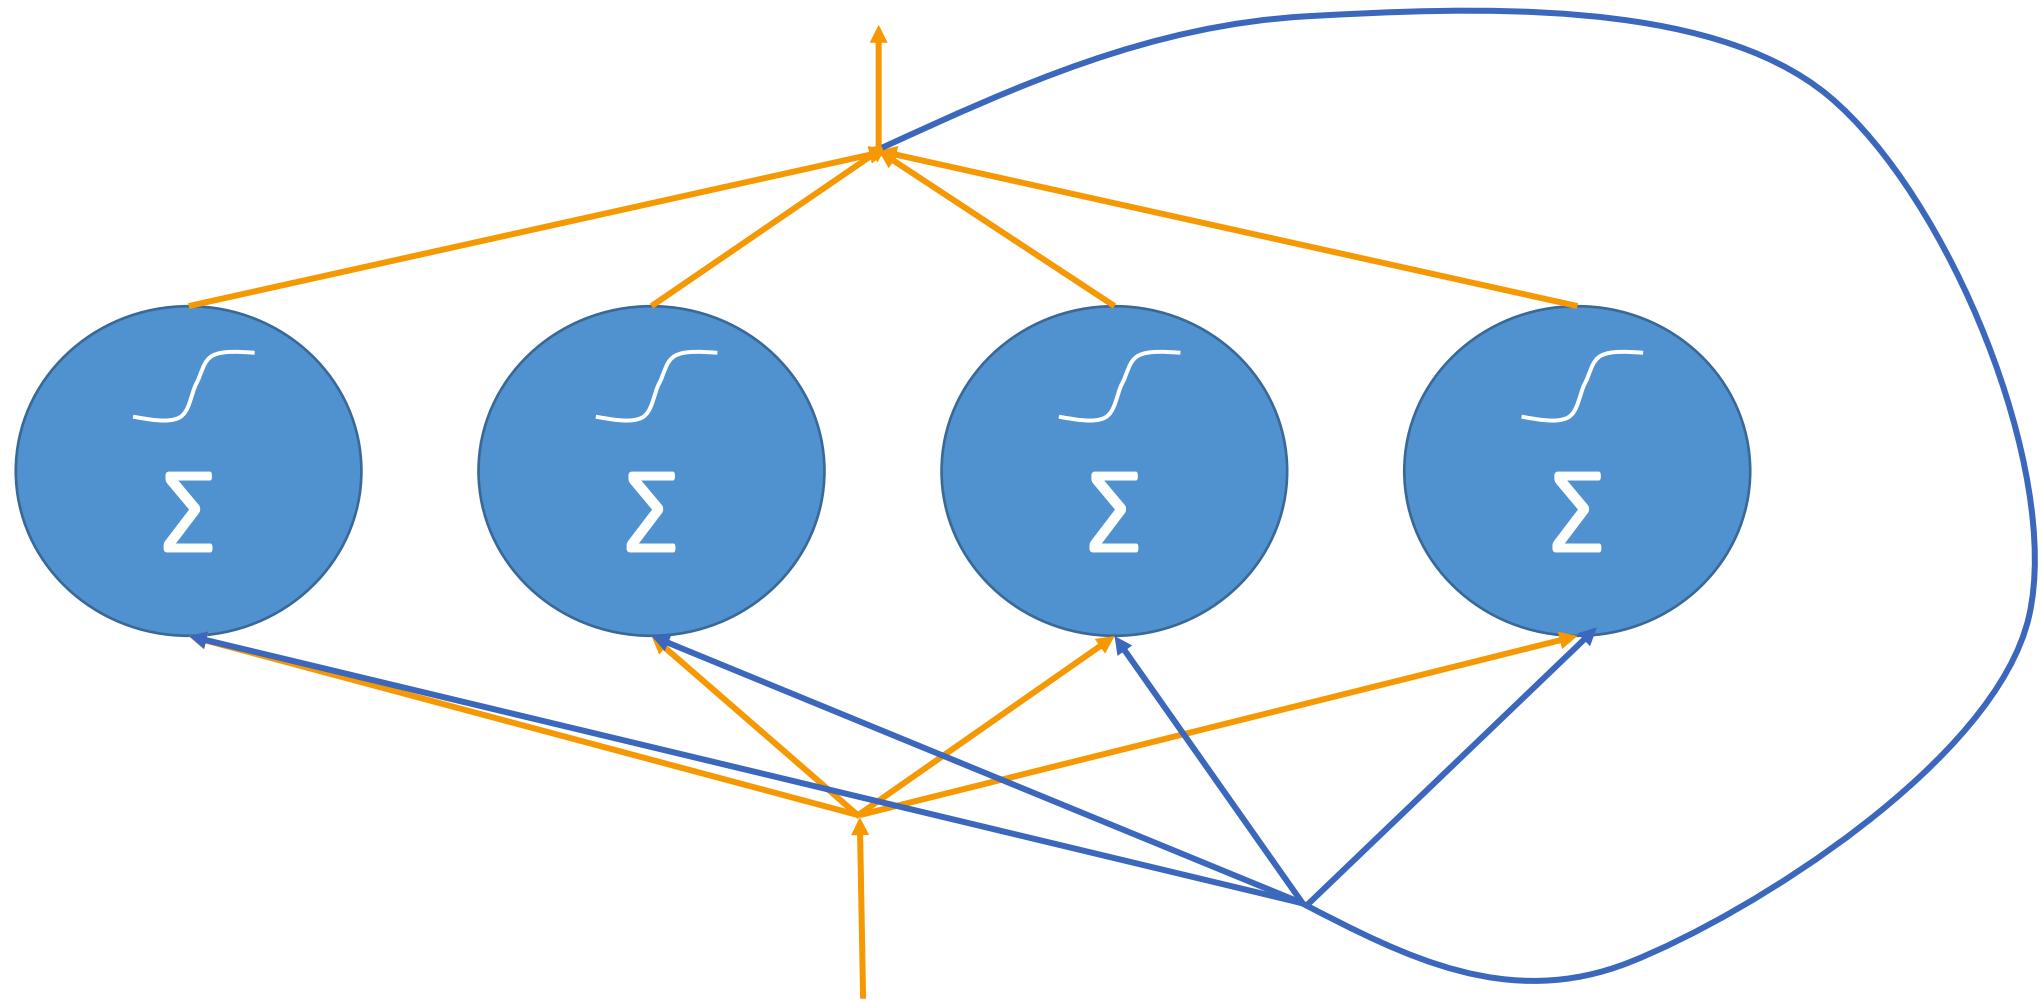

A recurrent neuron

Another way to look at it

A layer of recurrent neurons

RNN topologies

- Sequence to sequence
 - i.e., predict stock prices based on series of historical data
- Sequence to vector
 - i.e., words in a sentence to sentiment
- Vector to sequence
 - i.e., create captions from an image
- Encoder -> Decoder
 - Sequence -> vector -> sequence
 - i.e., machine translation

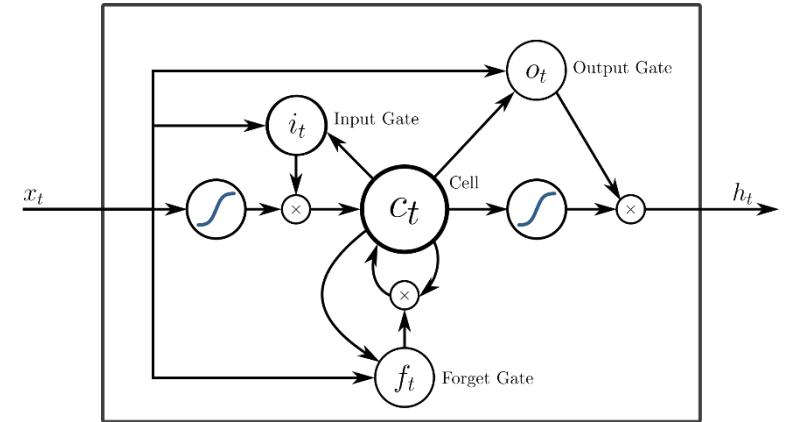

Training rnn's

- Backpropagation through time
 - Just like backpropagation on MLP's, but applied to each time step.
- All those time steps add up fast
 - Ends up looking like a really, really deep neural network.
 - Can limit backpropagation to a limited number of time steps (truncated backpropagation through time)

Training rnn's

- State from earlier time steps get diluted over time
 - This can be a problem, for example when learning sentence structures
- LSTM Cell
 - Long Short-Term Memory Cell
 - Maintains separate short-term and long-term states
- GRU Cell
 - Gated Recurrent Unit
 - Simplified LSTM Cell that performs about as well

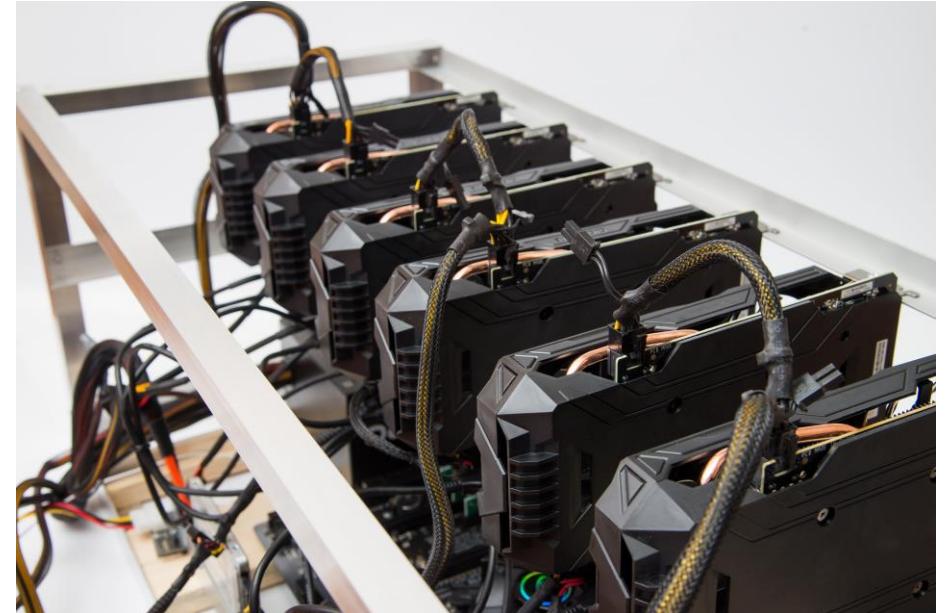

Training rnn's

- It's really hard
 - Very sensitive to topologies, choice of hyperparameters
 - Very resource intensive
 - A wrong choice can lead to a RNN that doesn't converge at all.

Deep Learning on EC2 / EMR

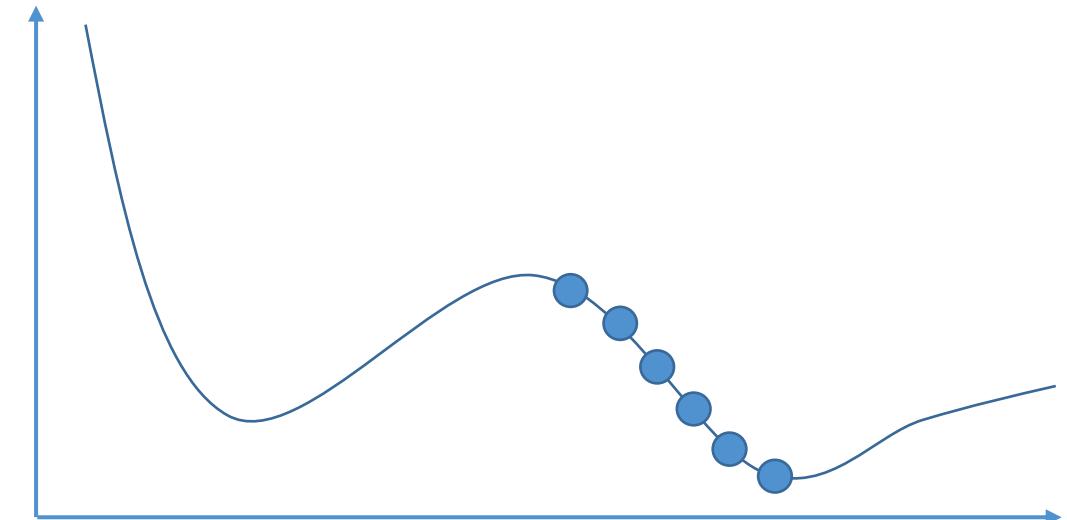

- EMR supports Apache MXNet and GPU instance types
- Appropriate instance types for deep learning:
 - P3: 8 Tesla V100 GPU's
 - P2: 16 K80 GPU's
 - G3: 4 M60 GPU's (all Nvidia chips)
- Deep Learning AMI's

Tuning Neural Networks

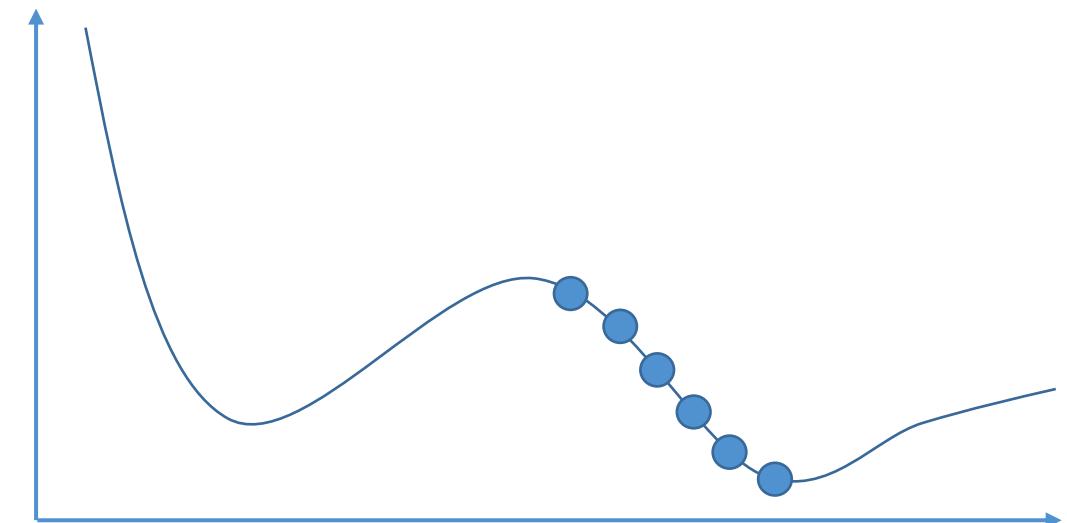

Learning Rate

- Neural networks are trained by gradient descent (or similar means)
- We start at some random point, and sample different solutions (weights) seeking to minimize some cost function, over many *epochs*
- How far apart these samples are is the *learning rate*

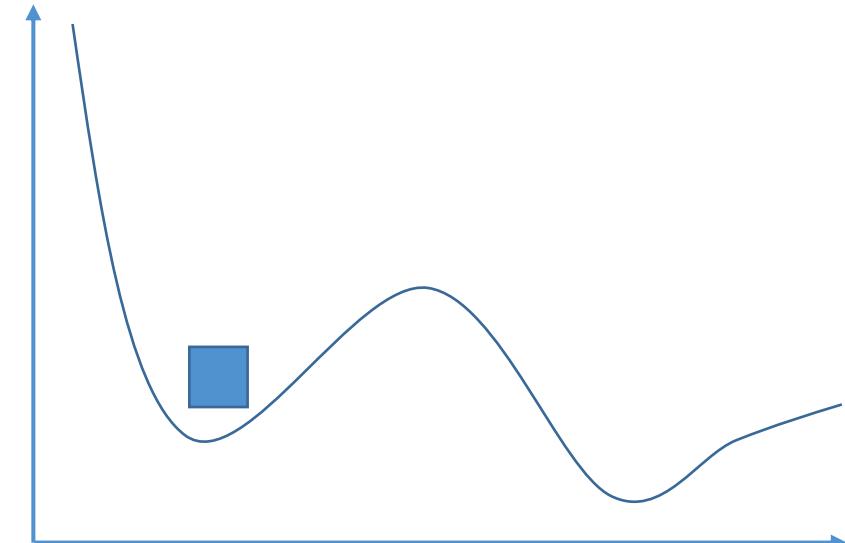

Effect of learning rate

- Too high a learning rate means you might overshoot the optimal solution!
- Too small a learning rate will take too long to find the optimal solution
- Learning rate is an example of a *hyperparameter*

Batch Size

- How many training samples are used within each epoch
- Somewhat counter-intuitively:
 - Smaller batch sizes can work their way out of “local minima” more easily
 - Batch sizes that are too large can end up getting stuck in the wrong solution
 - Random shuffling at each epoch can make this look like very inconsistent results from run to run

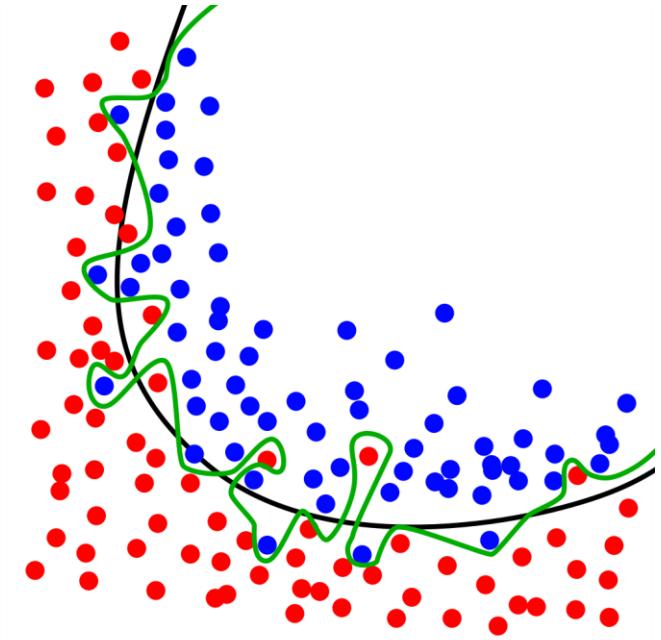

To Recap (this is important!)

- Small batch sizes tend to not get stuck in local minima
- Large batch sizes can converge on the wrong solution at random
- Large learning rates can overshoot the correct solution
- Small learning rates increase training time

Neural Network Regularization Techniques

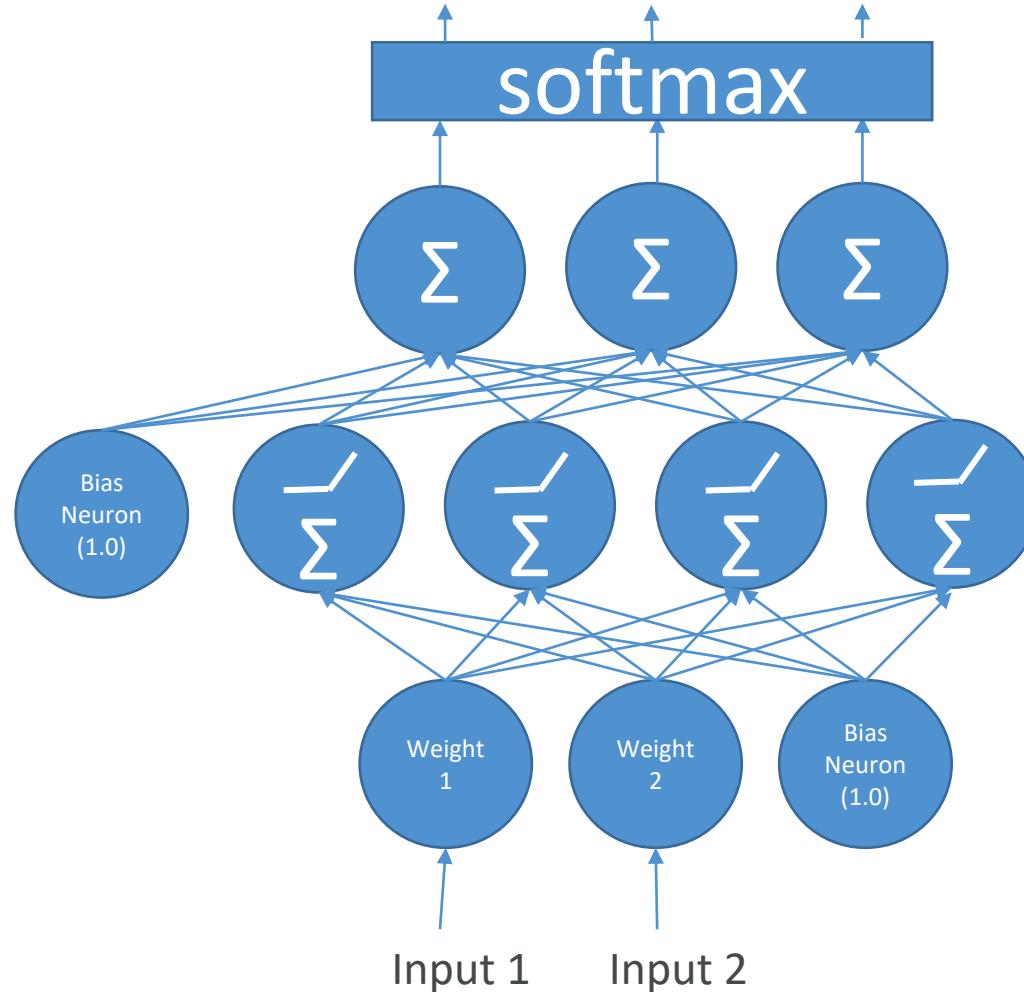

What is regularization?

- Preventing *overfitting*
 - Models that are good at making predictions on the data they were trained on, but not on new data it hasn't seen before
 - Overfitted models have learned patterns in the training data that don't generalize to the real world
 - Often seen as high accuracy on training data set, but lower accuracy on test or evaluation data set.
 - When training and evaluating a model, we use *training*, *evaluation*, and *testing* data sets.
- Regularization techniques are intended to prevent overfitting.

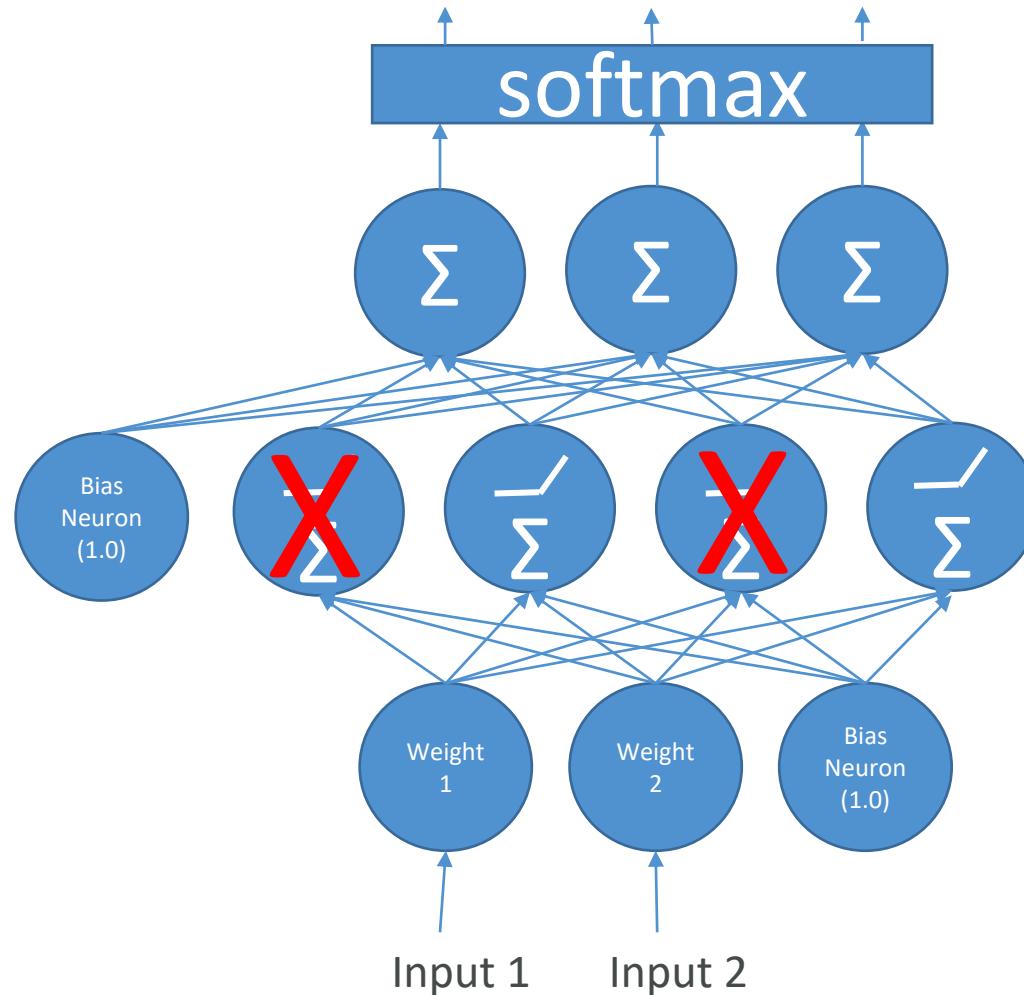

Chabacano [CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/>)]

Too many layers? Too many neurons?

Dropout

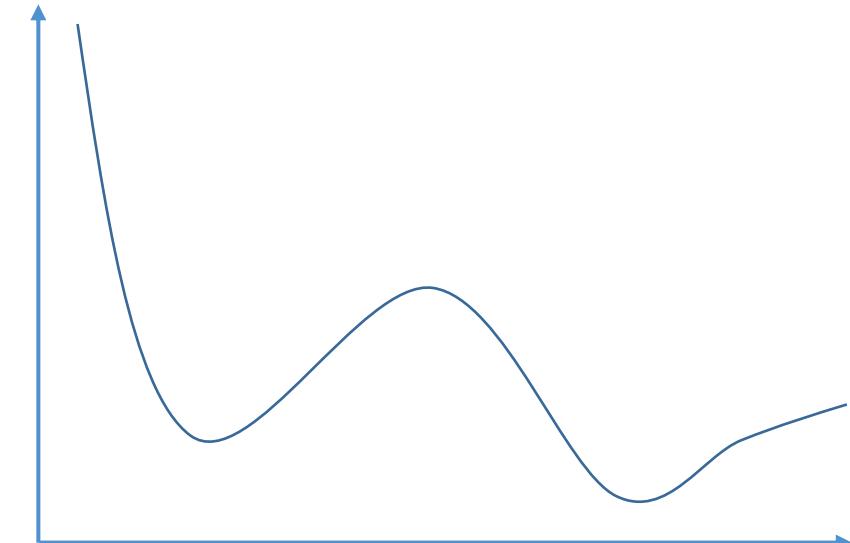

Early Stopping

```
Epoch 1/10
- 4s - loss: 0.2406 - acc: 0.9302 - val_loss: 0.1437 - val_acc: 0.9557
Epoch 2/10
- 2s - loss: 0.0971 - acc: 0.9712 - val_loss: 0.0900 - val_acc: 0.9725
Epoch 3/10

Epoch 10/10
- 2s - loss: 0.0097 - acc: 0.9972 - val_loss: 0.0807 - val_acc: 0.9805
```

Grief with Gradients

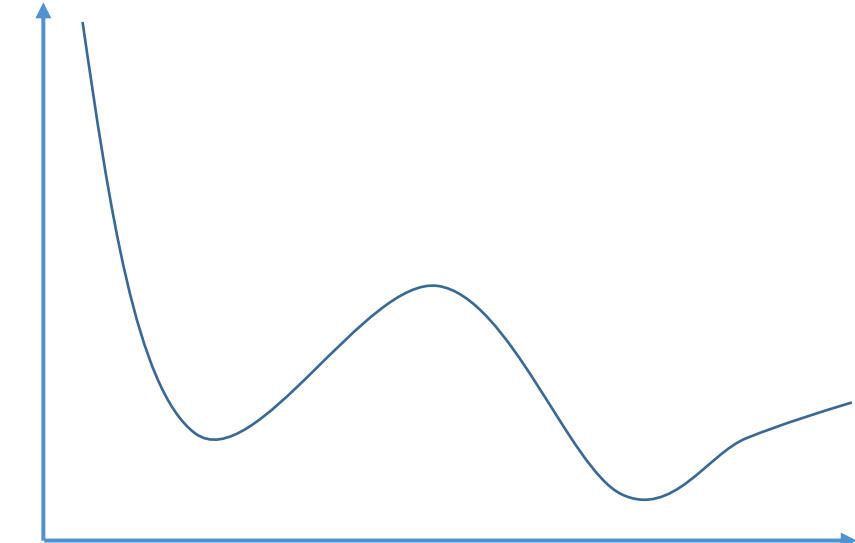

The Vanishing Gradient Problem

- When the slope of the learning curve approaches zero, things can get stuck
- We end up working with very small numbers that slow down training, or even introduce numerical errors
- Becomes a problem with deeper networks and RNN's as these "vanishing gradients" propagate to deeper layers
- Opposite problem: "exploding gradients"

Fixing the Vanishing Gradient Problem

- Multi-level heirarchy
 - Break up levels into their own sub-networks trained individually
- Long short-term memory (LSTM)
- Residual Networks
 - i.e., ResNet
 - Ensemble of shorter networks
- Better choice of activation function
 - ReLU is a good choice

Gradient Checking

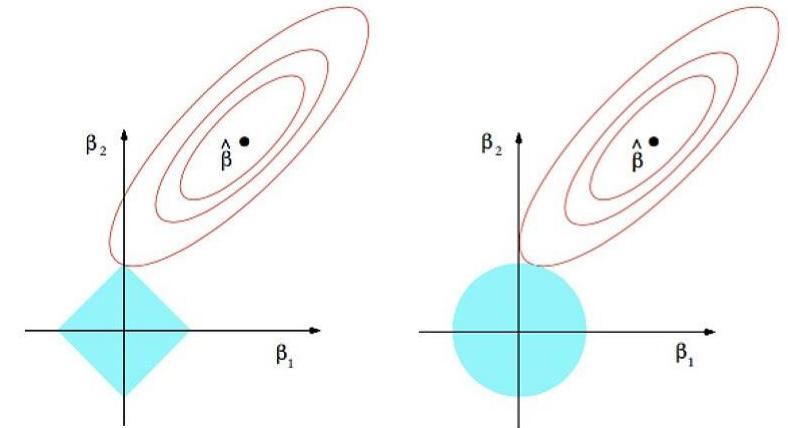

- A debugging technique
- Numerically check the derivatives computed during training
- Useful for validating code of neural network training
 - But you're probably not going to be writing this code...

L1 and L2 Regularization

L1 and L2 Regularization

- Preventing overfitting in ML in general
- A regularization term is added as weights are learned
- L1 term is the sum of the weights
 - $\lambda \sum_{i=1}^k |w_i|$
- L2 term is the sum of the square of the weights
 - $\lambda \sum_{i=1}^k w_i^2$
- Same idea can be applied to loss functions

Xiaoli C. [CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/>)]

What's the difference?

- L1: sum of weights
 - Performs *feature selection* – entire features go to 0
 - Computationally inefficient
 - Sparse output
- L2: sum of square of weights
 - All features remain considered, just weighted
 - Computationally efficient
 - Dense output

Why would you want L1?

- Feature selection can reduce dimensionality
 - Out of 100 features, maybe only 10 end up with non-zero coefficients!
 - The resulting sparsity can make up for its computational inefficiency
- But, if you think all of your features are important, L2 is probably a better choice.

Confusion Matrix

Sometimes accuracy doesn't tell the whole story

- A test for a rare disease can be 99.9% accurate by just guessing “no” all the time
- We need to understand true positives and true negative, as well as false positives and false negatives.
- A confusion matrix shows this.

Binary confusion matrix

	Actual YES	Actual NO
Predicted YES	TRUE POSITIVES	FALSE POSITIVES
Predicted NO	FALSE NEGATIVES	TRUE NEGATIVE

Image has cat?

	Actual cat	Actual not cat
Predicted cat	50	5
Predicted not cat	10	100

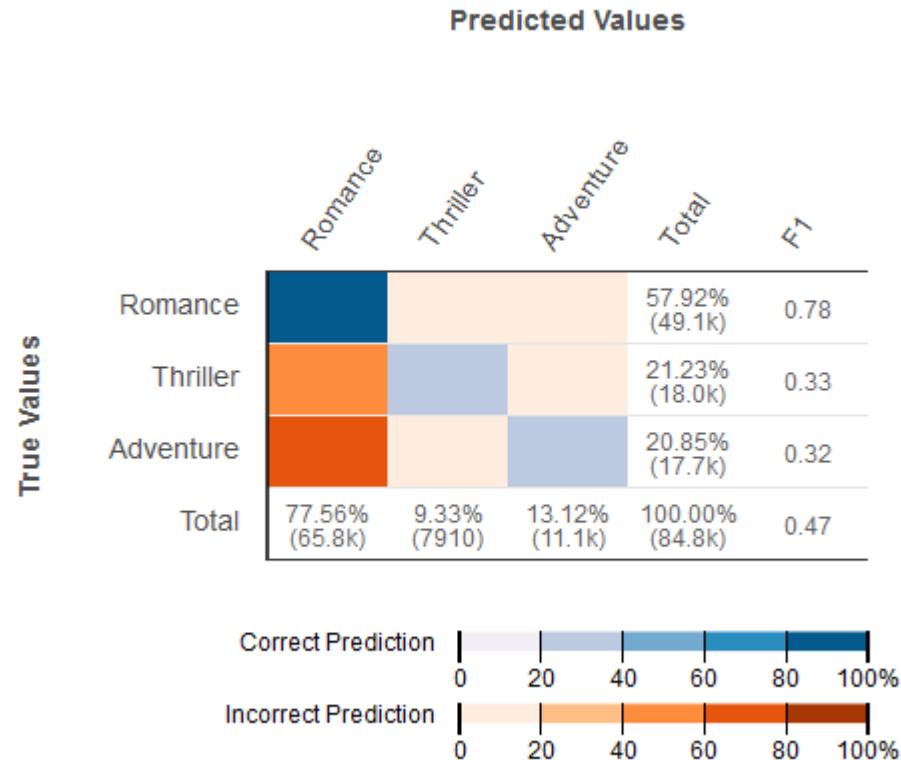

Another format

	Predicted NO	Predicted YES	
Actual NO	50	5	55
Actual YES	10	100	110
	60	105	

Multi-class confusion matrix + heat map

Example from the AWS docs

- # of correct and incorrect predictions per class (infer from colors of each cell)
- F1 scores per class
- True class frequencies: the “total” column
- Predicted class frequencies: the “total” row

Measuring your Models

Remember our friend the confusion matrix

	Actual YES	Actual NO
Predicted YES	TRUE POSITIVES	FALSE POSITIVES
Predicted NO	FALSE NEGATIVES	TRUE NEGATIVE

Recall

$$\frac{\text{TRUE POSITIVES}}{\text{TRUE POSITIVES} + \text{FALSE NEGATIVES}}$$

- AKA Sensitivity, True Positive rate, Completeness
- Percent of positives rightly predicted
- Good choice of metric when you care a lot about false negatives
 - i.e., fraud detection

Recall example

	Actual fraud	Actual not fraud
Predicted fraud	5	20
Predicted not fraud	10	100

$$\text{Recall} = \text{TP}/(\text{TP}+\text{FN})$$

$$\text{Recall} = 5/(5+10) = 5/15 = 1/3 = 33\%$$

Precision

TRUE POSITIVES

$$\bullet \frac{\text{TRUE POSITIVES}}{\text{TRUE POSITIVES} + \text{FALSE POSITIVES}}$$

- AKA Correct Positives
- Percent of relevant results
- Good choice of metric when you care a lot about false positives
 - i.e., medical screening, drug testing

Precision example

	Actual fraud	Actual not fraud
Predicted fraud	5	20
Predicted not fraud	10	100

$$\text{Precision} = \text{TP}/(\text{TP}+\text{FP})$$

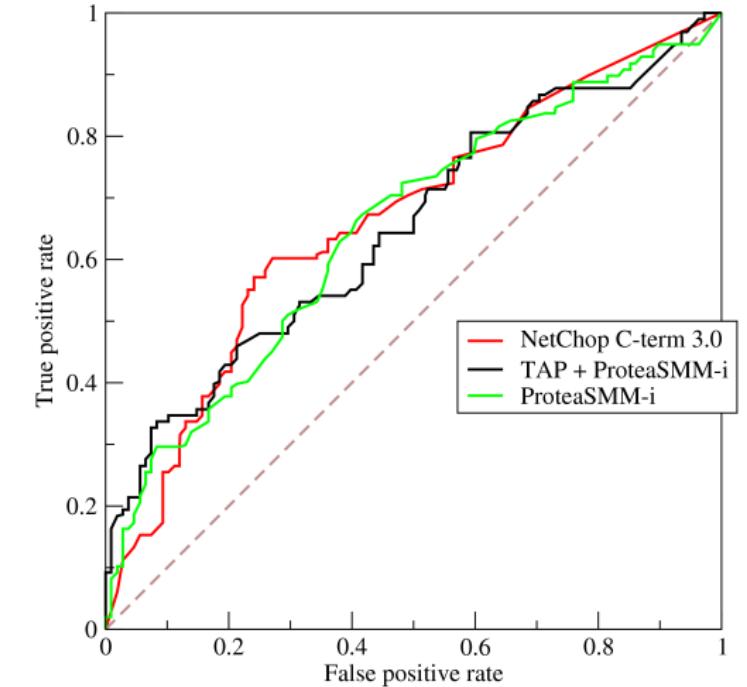

$$\text{Precision} = 5/(5+20) = 5/25 = 1/5 = 20\%$$

Other metrics

- Specificity = $\frac{TN}{TN+FP}$ = “True negative rate”
- F1 Score
 - $\frac{2TP}{2TP+FP+FN}$
 - $2 \cdot \frac{Precision \cdot Recall}{Precision + Recall}$
 - Harmonic mean of precision and sensitivity
 - When you care about precision AND recall
- RMSE
 - Root mean squared error, exactly what it sounds like
 - Accuracy measurement
 - Only cares about right & wrong answers

ROC Curve

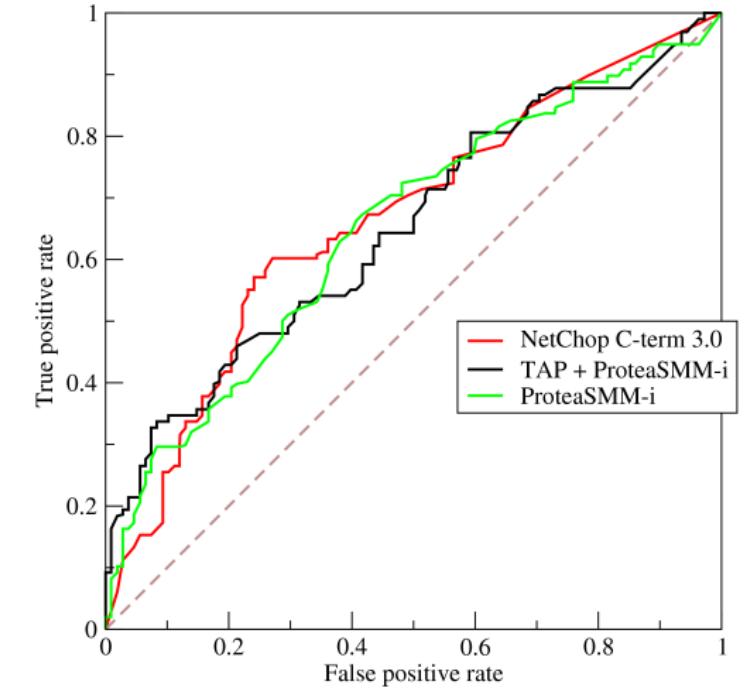

- Receiver Operating Characteristic Curve
- Plot of true positive rate (recall) vs. false positive rate at various threshold settings.
- Points above the diagonal represent good classification (better than random)
- Ideal curve would just be a point in the upper-left corner
- The more it's “bent” toward the upper-left, the better

BOR at the English language Wikipedia [CC BY-SA 3.0 (<http://creativecommons.org/licenses/by-sa/3.0/>)]

AUC

- The area under the ROC curve is... wait for it..
- Area Under the Curve (AUC)
- Equal to probability that a classifier will rank a randomly chosen positive instance higher than a randomly chosen negative one
- ROC AUC of 0.5 is a useless classifier, 1.0 is perfect
- Commonly used metric for comparing classifiers

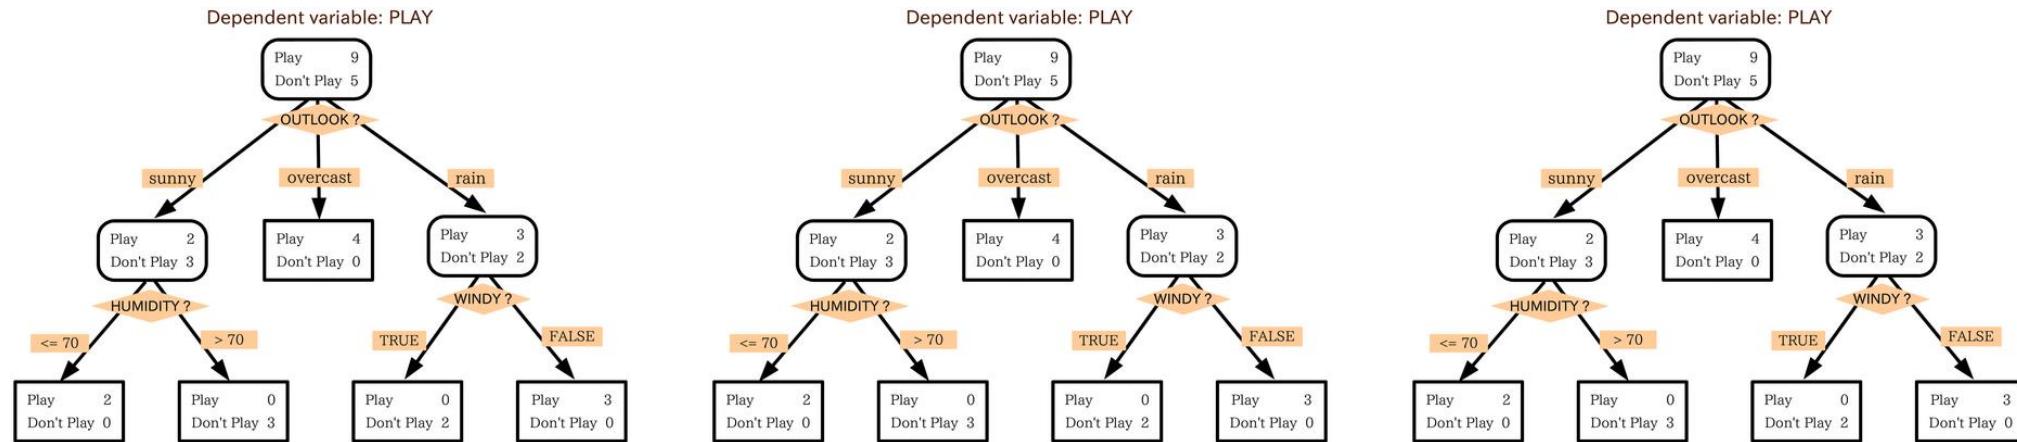

Ensemble Learning

Bagging & Boosting

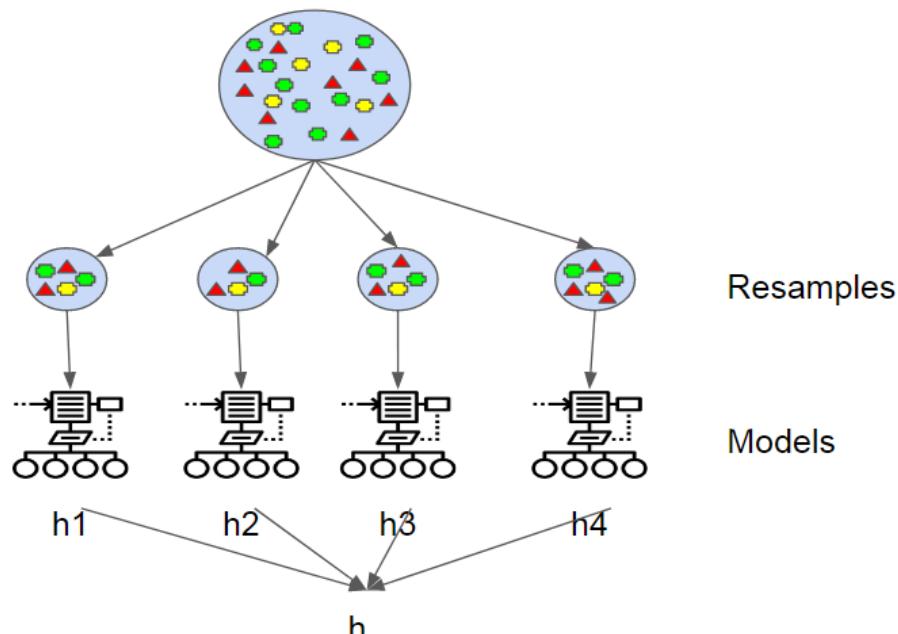

Ensemble methods

- Common example: random forest
 - Decision trees are prone to overfitting
 - So, make lots of decision trees and let them all vote on the result
 - This is a random forest
 - How do they differ?

Bagging

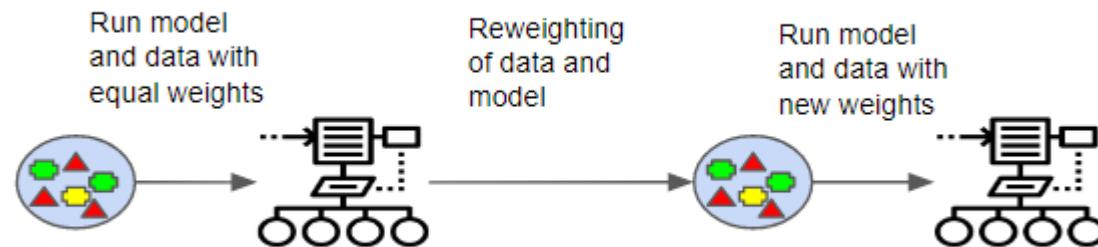

- Generate N new training sets by **random sampling with replacement**
- Each resampled model can be trained in parallel

SeattleDataGuy [CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/>)]

Boosting

- Observations are weighted
- Some will take part in new training sets more often
- Training is sequential; each classifier takes into account the previous one's success.

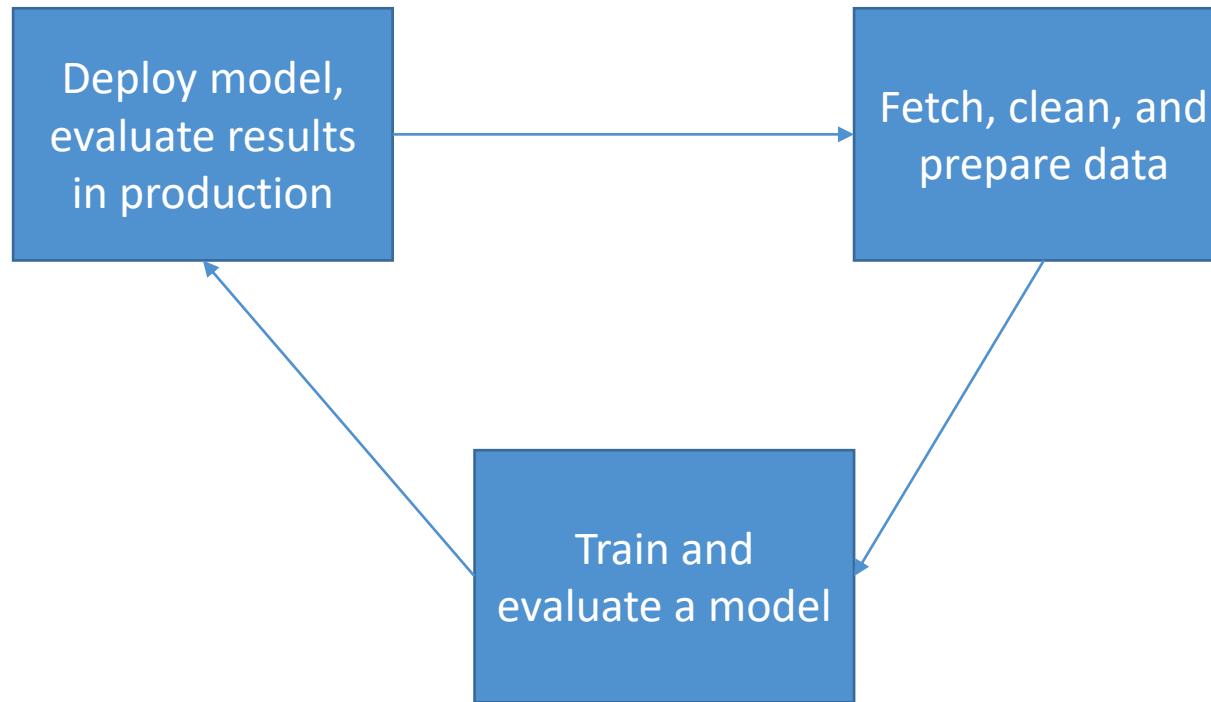

SeattleDataGuy [CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/>)]

Bagging vs. Boosting

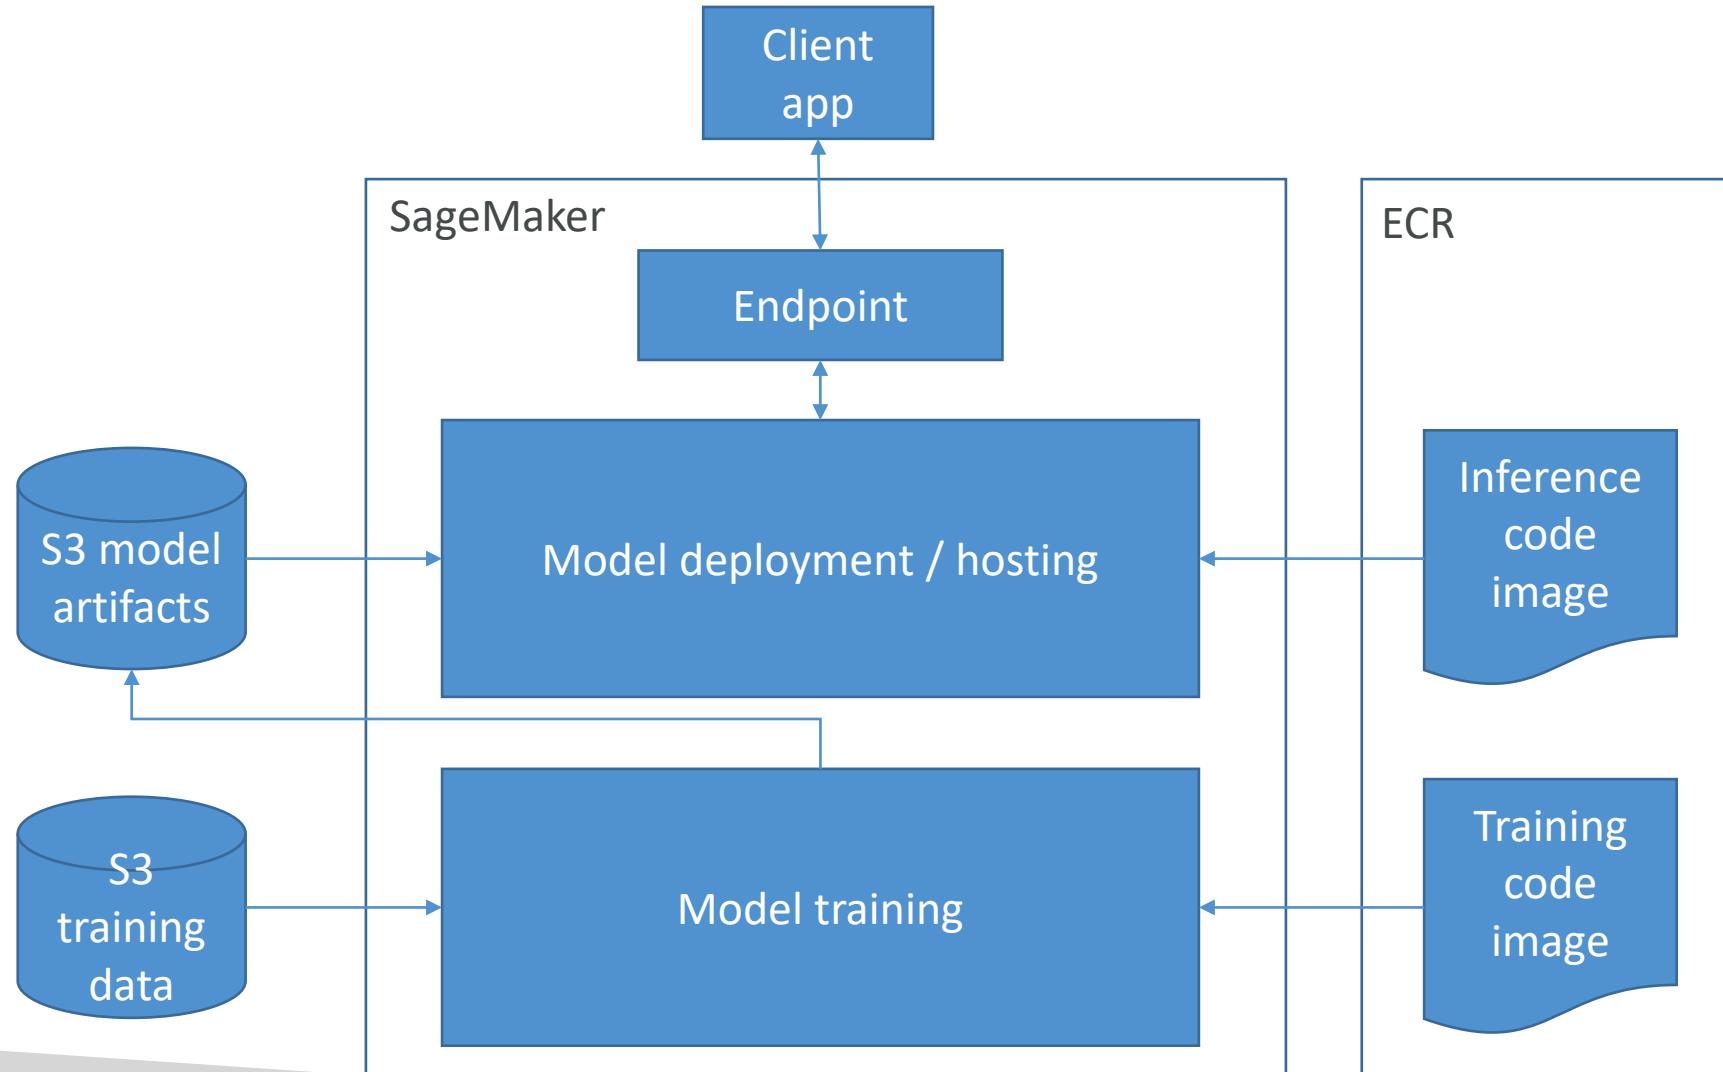

- XGBoost is the latest hotness
- Boosting generally yields better accuracy
- But bagging avoids overfitting
- Bagging is easier to parallelize
- So, depends on your goal

Amazon SageMaker

SageMaker is built to handle the entire machine learning workflow.

SageMaker Training & Deployment

SageMaker Notebooks can direct the process

- Notebook Instances on EC2 are spun up from the console
 - S3 data access
 - Scikit_learn, Spark, Tensorflow
 - Wide variety of built-in models
 - Ability to spin up training instances
 - Ability to deploy trained models for making predictions at scale

The screenshot shows a Jupyter notebook interface with the following sections:

- Save the MNIST dataset to disk**:
In [2]:

```
import os
import keras
import numpy as np
from keras.datasets import mnist
(x_train, y_train), (x_val, y_val) = mnist.load_data()

os.makedirs("./data", exist_ok = True)
np.savez('./data/training', image=x_train, label=y_train)
np.savez('./data/validation', image=x_val, label=y_val)
```
- Upload MNIST data to S3**:
Note that sess.upload_data automatically creates an S3 bucket that meets the security criteria of starting with "sagemaker-".
In [3]:

```
prefix = 'keras-mnist'

training_input_path = sess.upload_data('data/training.npz', key_prefix=prefix+'/training')
validation_input_path = sess.upload_data('data/validation.npz', key_prefix=prefix+'/validation')

print(training_input_path)
print(validation_input_path)

s3://sagemaker-us-east-1-159107795666/keras-mnist/training/training.npz
s3://sagemaker-us-east-1-159107795666/keras-mnist/validation/validation.npz
```
- Test out our CNN training script locally on the notebook instance**:
We'll test out running a single epoch, just to make sure the script works before we start spending money on P3 instances to train it further.
In [4]:

```
!pygmentize mnist-train-cnn.py
```

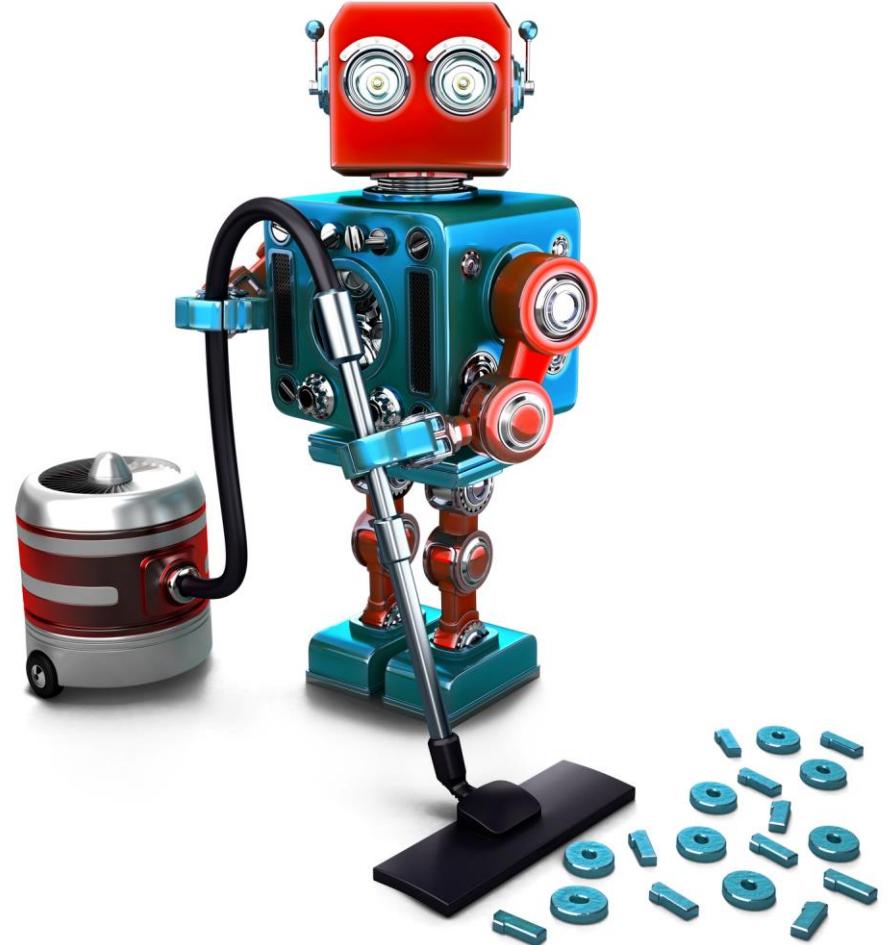

So can the SageMaker console

The screenshot shows the Amazon SageMaker console interface. The left sidebar contains navigation links for Dashboard, Search, Ground Truth (Labeling jobs, Labeling datasets, Labeling workforces), Notebook (Notebook instances, Lifecycle configurations, Git repositories), Training (Algorithms, Training jobs, Hyperparameter tuning jobs), Inference (Compilation jobs, Model packages, Models), and a Feedback link. The main content area is titled "Training jobs" and displays a table of completed training jobs. The table columns are Name, Creation time, Duration, and Status. Each row shows a unique job name starting with "sagemaker-tensorflow-", its creation time (Sep 26, 2019), duration (e.g., 4 minutes, 5 minutes), and a green checkmark indicating it is Completed.

Name	Creation time	Duration	Status
sagemaker-tensorflow-190926-1513-010-6f1bf0d5	Sep 26, 2019 15:30 UTC	4 minutes	Completed
sagemaker-tensorflow-190926-1513-009-53c7332e	Sep 26, 2019 15:30 UTC	3 minutes	Completed
sagemaker-tensorflow-190926-1513-008-a53612ca	Sep 26, 2019 15:26 UTC	4 minutes	Completed
sagemaker-tensorflow-190926-1513-007-b06a4d5b	Sep 26, 2019 15:26 UTC	4 minutes	Completed
sagemaker-tensorflow-190926-1513-006-167e1e3c	Sep 26, 2019 15:22 UTC	3 minutes	Completed
sagemaker-tensorflow-190926-1513-005-fd89504c	Sep 26, 2019 15:21 UTC	5 minutes	Completed
sagemaker-tensorflow-190926-1513-004-4a31fc9c	Sep 26, 2019 15:17 UTC	4 minutes	Completed
sagemaker-tensorflow-190926-1513-003-187d6ee7	Sep 26, 2019 15:17 UTC	5 minutes	Completed
sagemaker-tensorflow-190926-1513-002-0fd0ad85	Sep 26, 2019 15:14 UTC	4 minutes	Completed
sagemaker-tensorflow-190926-1513-001-7f7cf798	Sep 26, 2019 15:14 UTC	3 minutes	Completed

Data prep on SageMake

- Data must come from S3
 - Ideal format varies with algorithm – often it is RecordIO / Protobuf
- Apache Spark integrates with SageMaker
 - More on this later...
- Scikit_learn, numpy, pandas all at your disposal within a notebook

Training on SageMaker

- Create a training job
 - URL of S3 bucket with training data
 - ML compute resources
 - URL of S3 bucket for output
 - ECR path to training code
- Training options
 - Built-in training algorithms
 - Spark MLLib
 - Custom Python Tensorflow / MXNet code
 - Your own Docker image
 - Algorithm purchased from AWS marketplace

Deploying Trained Models

- Save your trained model to S3
- Can deploy two ways:
 - Persistent endpoint for making individual predictions on demand
 - SageMaker Batch Transform to get predictions for an entire dataset
- Lots of cool options
 - Inference Pipelines for more complex processing
 - SageMaker Neo for deploying to edge devices
 - Elastic Inference for accelerating deep learning models
 - Automatic scaling (increase # of endpoints as needed)

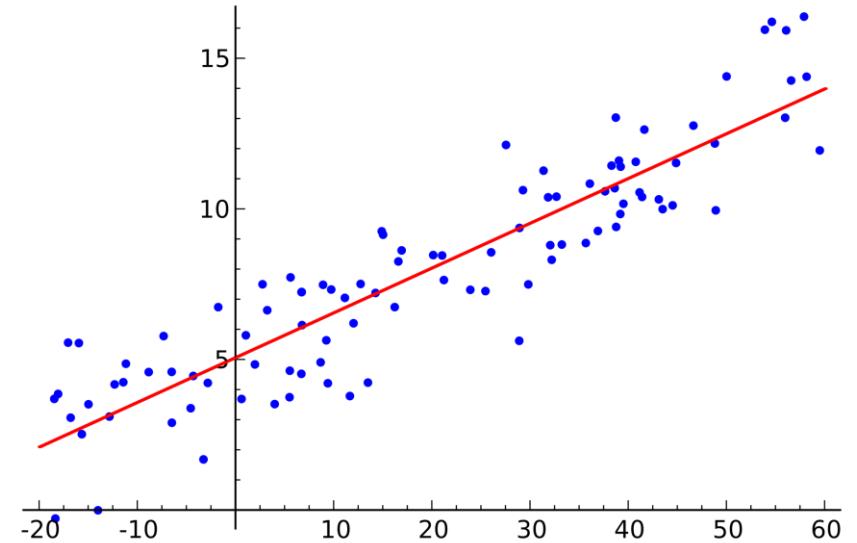

SageMaker's Built-In Algorithms

Linear Learner

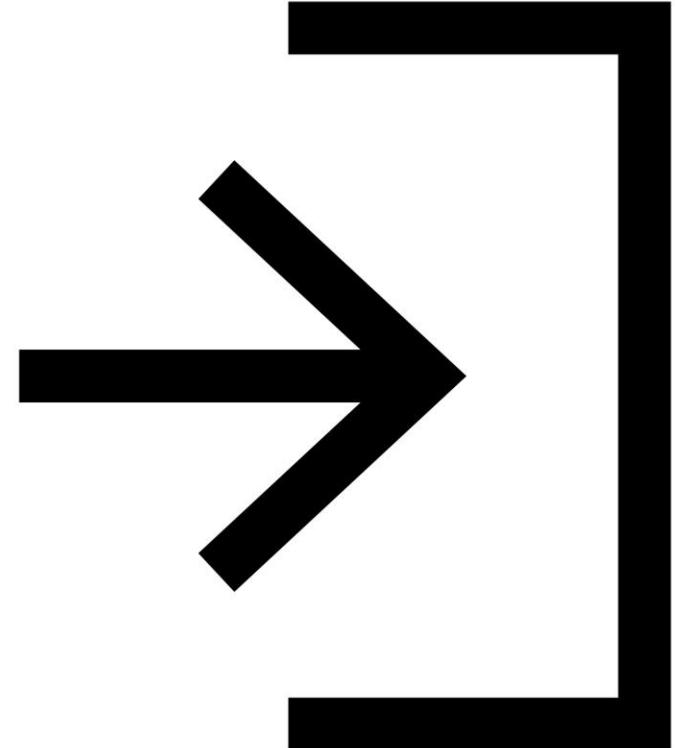

Linear Learner: What's it for?

- Linear regression
 - Fit a line to your training data
 - Predictions based on that line
- Can handle both regression (numeric) predictions and classification predictions
 - For classification, a linear threshold function is used.
 - Can do binary or multi-class

Linear Learner: What training input does it expect?

- RecordIO-wrapped protobuf
 - Float32 data only!
- CSV
 - First column assumed to be the label
- File or Pipe mode both supported

Linear Learner: How is it used?

- Preprocessing
 - Training data must be *normalized* (so all features are weighted the same)
 - Linear Learner can do this for you automatically
 - Input data should be *shuffled*
- Training
 - Uses stochastic gradient descent
 - Choose an optimization algorithm (Adam, AdaGrad, SGD, etc)
 - Multiple models are optimized in parallel
 - Tune L1, L2 regularization
- Validation
 - Most optimal model is selected

Linear Learner: Important Hyperparameters

- Balance_multiclass_weights
 - Gives each class equal importance in loss functions
- Learning_rate, mini_batch_size
- L1
 - Regularization
- Wd
 - Weight decay (L2 regularization)

Linear Learner: Instance Types

- Training
 - Single or multi-machine CPU or GPU
 - Multi-GPU does not help

Example

The screenshot shows a Jupyter Notebook interface with the title bar 'jupyter linear_learner_mnist (autosaved)'. The menu bar includes File, Edit, View, Insert, Cell, Kernel, Widgets, Help, Trusted, and conda_python3. The toolbar has icons for file operations like New, Open, Save, Run, Kernel, Cell, Widgets, Help, and nbdiff.

Data inspection

Once the dataset is imported, it's typical as part of the machine learning process to inspect the data, understand the distributions, and determine what type(s) of preprocessing might be needed. You can perform those tasks right here in the notebook. As an example, let's go ahead and look at one of the digits that is part of the dataset.

In [3]:

```
%matplotlib inline
import matplotlib.pyplot as plt
plt.rcParams["figure.figsize"] = (2,10)

def show_digit(img, caption='', subplot=None):
    if subplot==None:
        _,(subplot)=plt.subplots(1,1)
    imgr=img.reshape((28,28))
    subplot.axis('off')
    subplot.imshow(imgr, cmap='gray')
    subplot.title(caption)

show_digit(train_set[0][30], 'This is a {}'.format(train_set[1][30]))
```

This is a 3

Data conversion

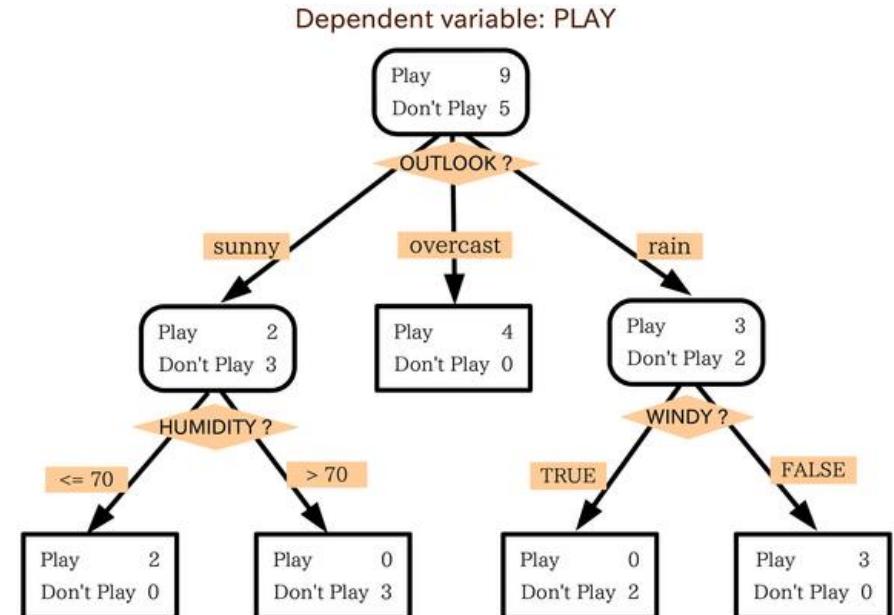

Since algorithms have particular input and output requirements, converting the dataset is also part of the process that a data scientist goes through prior to initiating training. In this particular case, the Amazon SageMaker implementation of Linear Learner takes recordIO-wrapped protobuf, where the data we have today is a pickle-sized numpy array on disk.

Most of the conversion effort is handled by the Amazon SageMaker Python SDK, imported as `sagemaker` below.

XGBoost

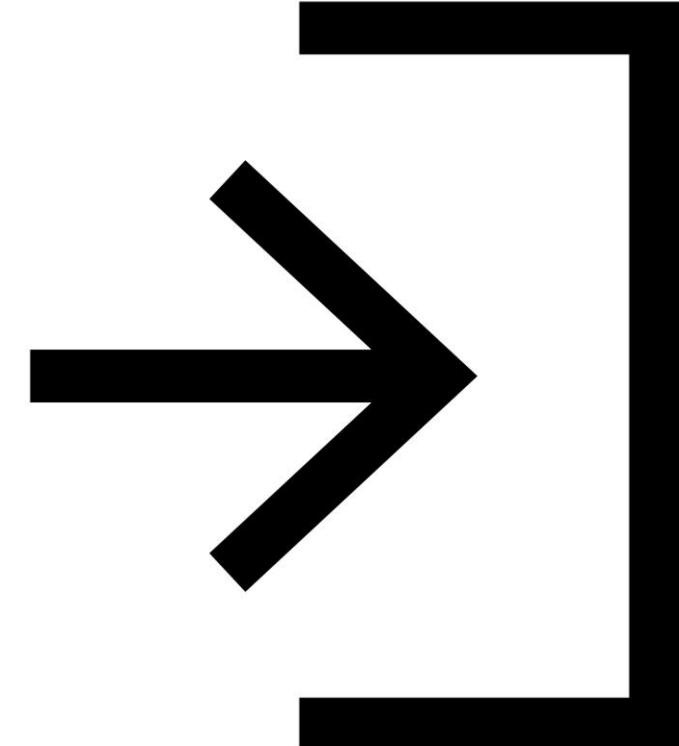

XGBoost: What's it for?

- eXtreme Gradient Boosting
 - Boosted group of decision trees
 - New trees made to correct the errors of previous trees
 - Uses gradient descent to minimize loss as new trees are added
- It's been winning a lot of Kaggle competitions
 - And it's fast, too
- Can be used for classification
- And also for regression
 - Using regression trees

XGBoost: What training input does it expect?

- XGBoost is weird, since it's not made for SageMaker. It's just open source XGBoost
- So, it takes CSV or libsvm input.
- AWS recently extended it to accept recordIO-protobuf and Parquet as well.

XGBoost: How is it used?

- Models are serialized/deserialized with Pickle
- Can use as a framework within notebooks
 - Sagemaker.xgboost
- Or as a built-in SageMaker algorithm

XGBoost: Important Hyperparameters

- There are a lot of them. A few:
- Subsample
 - Prevents overfitting
- Eta
 - Step size shrinkage, prevents overfitting
- Gamma
 - Minimum loss reduction to create a partition;
larger = more conservative
- Alpha
 - L1 regularization term; larger = more conservative
- Lambda
 - L2 regularization term; larger = more conservative

XGBoost: Important Hyperparameters

- eval_metric
 - Optimize on AUC, error, rmse...
 - For example, if you care about false positives more than accuracy, you might use AUC here
- scale_pos_weight
 - Adjusts balance of positive and negative weights
 - Helpful for unbalanced classes
 - Might set to $\text{sum}(\text{negative cases}) / \text{sum}(\text{positive cases})$
- max_depth
 - Max depth of the tree
 - Too high and you may overfit

XGBoost: Instance Types

- Uses CPU's only for multiple instance training
- Is memory-bound, not compute-bound
- So, **M5** is a good choice
- As of XGBoost 1.2, single-instance GPU training is available
 - For example **P3**
 - Must set tree_method hyperparameter to gpu_hist
 - Trains more quickly and can be more cost effective.

Seq2Seq

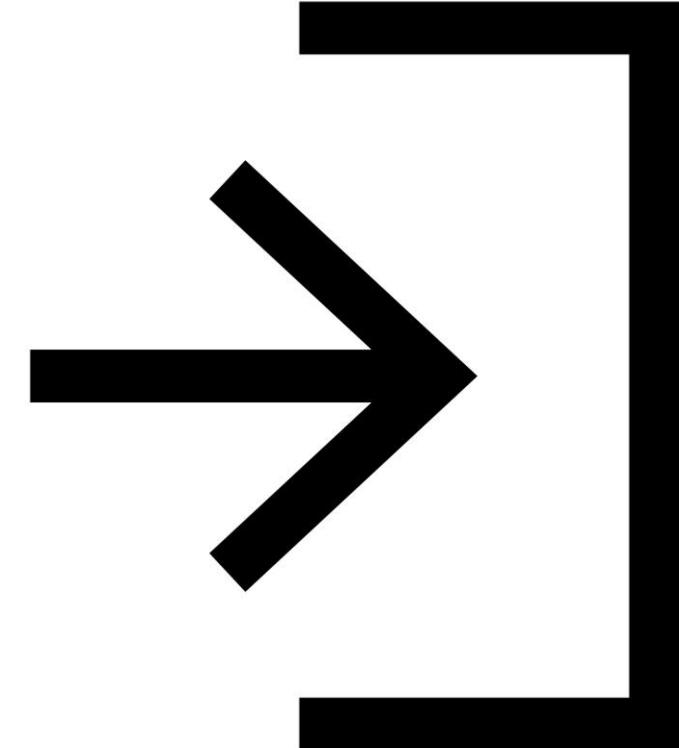

Seq2Seq: What's it for?

- Input is a sequence of tokens, output is a sequence of tokens
- Machine Translation
- Text summarization
- Speech to text
- Implemented with RNN's and CNN's with attention

Seq2Seq: What training input does it expect?

- RecordIO-Protobuf
 - Tokens must be integers (this is unusual, since most algorithms want floating point data.)
- Start with tokenized text files
- Convert to protobuf using sample code
 - Packs into integer tensors with vocabulary files
 - A lot like the TF/IDF lab we did earlier.
- Must provide training data, validation data, and vocabulary files.

Seq2Seq: How is it used?

- Training for machine translation can take days, even on SageMaker
- Pre-trained models are available
 - See the example notebook
- Public training datasets are available for specific translation tasks

Seq2Seq: Important Hyperparameters

- Batch_size
- Optimizer_type (adam, sgd, rmsprop)
- Learning_rate
- Num_layers_encoder
- Num_layers_decoder
- Can optimize on:
 - Accuracy
 - Vs. provided validation dataset
 - BLEU score
 - Compares against multiple reference translations
 - Perplexity
 - Cross-entropy

Seq2Seq: Instance Types

- Can only use GPU instance types (P3 for example)
- Can only use a single machine for training
 - But can use multi-GPU's on one machine

DeepAR

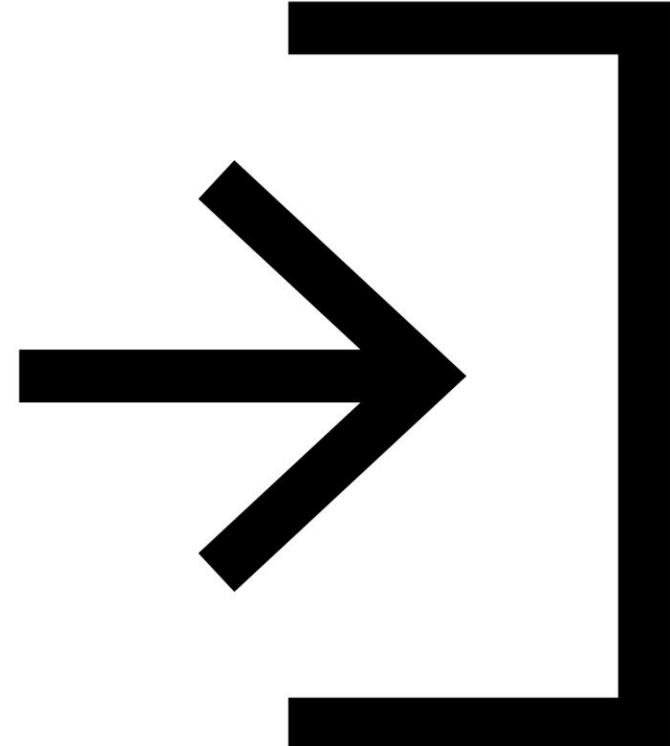

DeepAR: What's it for?

- Forecasting one-dimensional time series data
- Uses RNN's
- Allows you to train the same model over several related time series
- Finds frequencies and seasonality

DeepAR: What training input does it expect?

- JSON lines format
 - Gzip or Parquet
- Each record must contain:
 - Start: the starting time stamp
 - Target: the time series values
- Each record can contain:
 - Dynamic_feat: dynamic features (such as, was a promotion applied to a product in a time series of product purchases)
 - Cat: categorical features

```
{"start": "2009-11-01 00:00:00", "target": [4.3, "NaN", 5.1, ...], "cat": [0, 1], "dynamic_feat": [[1.1, 1.2, 0.5, ...]}  
{"start": "2012-01-30 00:00:00", "target": [1.0, -5.0, ...], "cat": [2, 3], "dynamic_feat": [[1.1, 2.05, ...]}  
{"start": "1999-01-30 00:00:00", "target": [2.0, 1.0], "cat": [1, 4], "dynamic_feat": [[1.3, 0.4]]}
```

DeepAR: How is it used?

- Always include entire time series for training, testing, and inference
- Use entire dataset as training set, remove last time points for testing. Evaluate on withheld values.
- Don't use very large values for prediction length (> 400)
- Train on many time series and not just one when possible

DeepAR: Important Hyperparameters

- Context_length
 - Number of time points the model sees before making a prediction
 - Can be smaller than seasonalities; the model will lag one year anyhow.
- Epochs
- mini_batch_size
- Learning_rate
- Num_cells

DeepAR: Instance Types

- Can use CPU or GPU
- Single or multi machine
- Start with CPU (C4.2xlarge, C4.4xlarge)
- Move up to GPU if necessary
 - Only helps with larger models
- CPU-only for inference
- May need larger instances for tuning

BlazingText

BlazingText: What's it for?

- Text classification
 - Predict labels for a sentence
 - Useful in web searches, information retrieval
 - Supervised
- Word2vec
 - Creates a vector representation of words
 - Semantically similar words are represented by vectors close to each other
 - This is called a *word embedding*
 - It is useful for NLP, but is not an NLP algorithm in itself!
 - Used in machine translation, sentiment analysis
 - Remember it only works on individual words, not sentences or documents

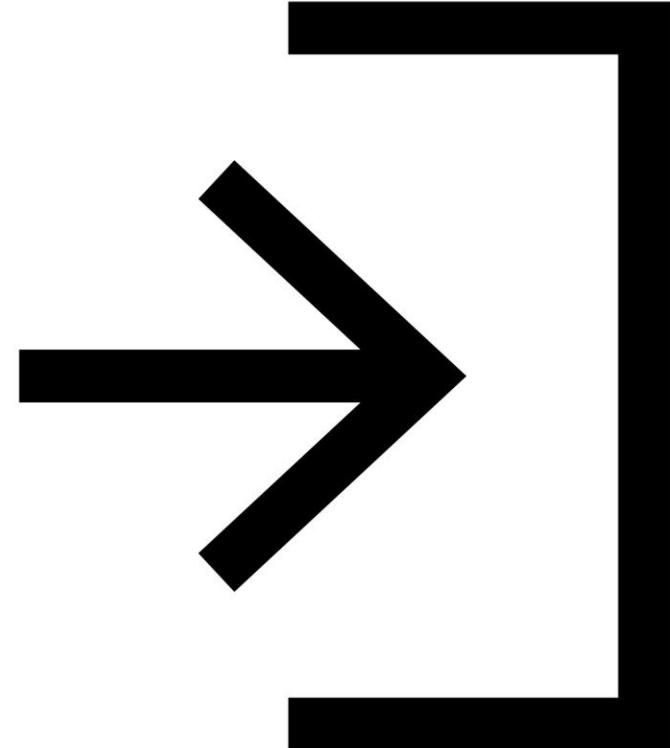

BlazingText: What training input does it expect?

- For supervised mode (text classification):
 - One sentence per line
 - First “word” in the sentence is the string label followed by the label
- Also, “augmented manifest text format”
- Word2vec just wants a text file with one training sentence per line.

label_4 linux ready for prime time , intel says , despite all the linux hype , the open-source movement has yet to make a huge splash in the desktop market . that may be about to change , thanks to chipmaking giant intel corp .

label_2 bowled by the slower one again , kolkata , november 14 the past caught up with sourav ganguly as the indian skippers return to international cricket was short lived .

```
{"source":"linux ready for prime time , intel says , despite all the linux hype", "label":1}  
 {"source":"bowled by the slower one again , kolkata , november 14 the past caught up with sourav ganguly", "label":2}
```

BlazingText: How is it used?

- Word2vec has multiple modes
 - Cbow (Continuous Bag of Words)
 - Skip-gram
 - Batch skip-gram
 - Distributed computation over many CPU nodes

BlazingText: Important Hyperparameters

- Word2vec:
 - Mode (batch_skipgram, skipgram, cbow)
 - Learning_rate
 - Window_size
 - Vector_dim
 - Negative_samples
- Text classification:
 - Epochs
 - Learning_rate
 - Word_ngrams
 - Vector_dim

BlazingText: Instance Types

- For cbow and skipgram, recommend a single ml.p3.2xlarge
 - Any single CPU or single GPU instance will work
- For batch_skipgram, can use single or multiple CPU instances
- For text classification, C5 recommended if less than 2GB training data. For larger data sets, use a single GPU instance (ml.p2.xlarge or ml.p3.2xlarge)

Object2Vec

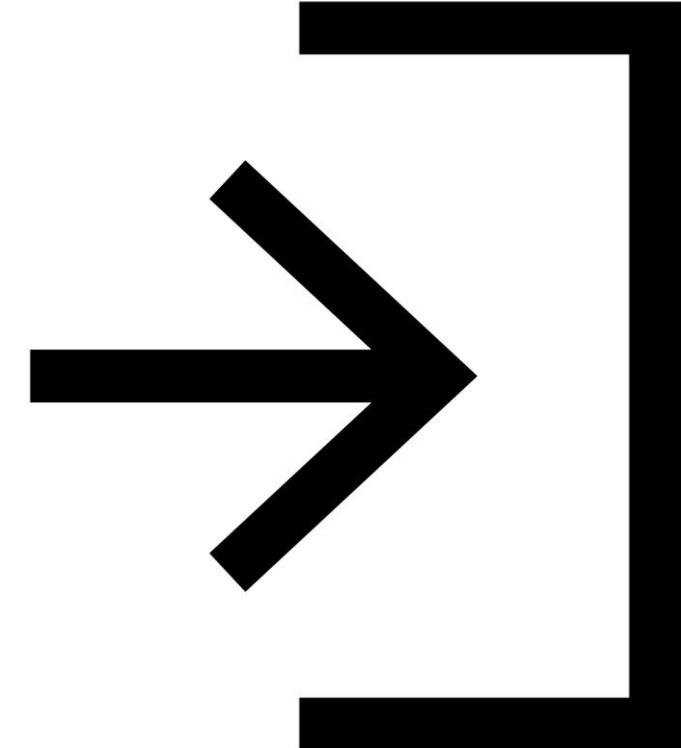

Object2Vec: What's it for?

- Remember word2vec from Blazing Text?
It's like that, but arbitrary objects
- It creates low-dimensional dense embeddings of high-dimensional objects
- It is basically word2vec, generalized to handle things other than words.
- Compute nearest neighbors of objects
- Visualize clusters
- Genre prediction
- Recommendations (similar items or users)
- Unsupervised

Object2Vec: What training input does it expect?

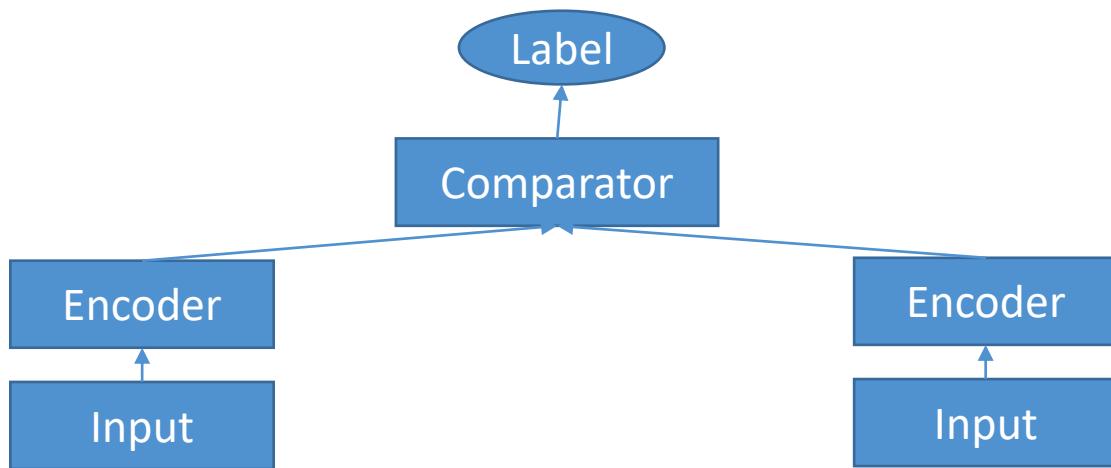

- Data must be tokenized into integers
- Training data consists of pairs of tokens and/or sequences of tokens
 - Sentence – sentence
 - Labels-sequence (genre to description?)
 - Customer-customer
 - Product-product
 - User-item

```
{"label": 0, "in0": [6, 17, 606, 19, 53, 67, 52, 12, 5, 10, 15, 10178, 7, 33, 652, 80, 15, 69, 821, 4], "in1": [16, 21, 13, 45, 14, 9, 80, 59, 164, 4]}  
{"label": 1, "in0": [22, 1016, 32, 13, 25, 11, 5, 64, 573, 45, 5, 80, 15, 67, 21, 7, 9, 107, 4], "in1": [22, 32, 13, 25, 1016, 573, 3252, 4]}  
{"label": 1, "in0": [774, 14, 21, 206], "in1": [21, 366, 125]}
```

Object2Vec: How is it used?

- Process data into JSON Lines and shuffle it
- Train with two input channels, two encoders, and a comparator
- Encoder choices:
 - Average-pooled embeddings
 - CNN's
 - Bidirectional LSTM
- Comparator is followed by a feed-forward neural network

Object2Vec: Important Hyperparameters

- The usual deep learning ones...
 - Dropout, early stopping, epochs, learning rate, batch size, layers, activation function, optimizer, weight decay
- Enc1_network, enc2_network
 - Choose hcnn, bilstm, pooled_embedding

Object2Vec: Instance Types

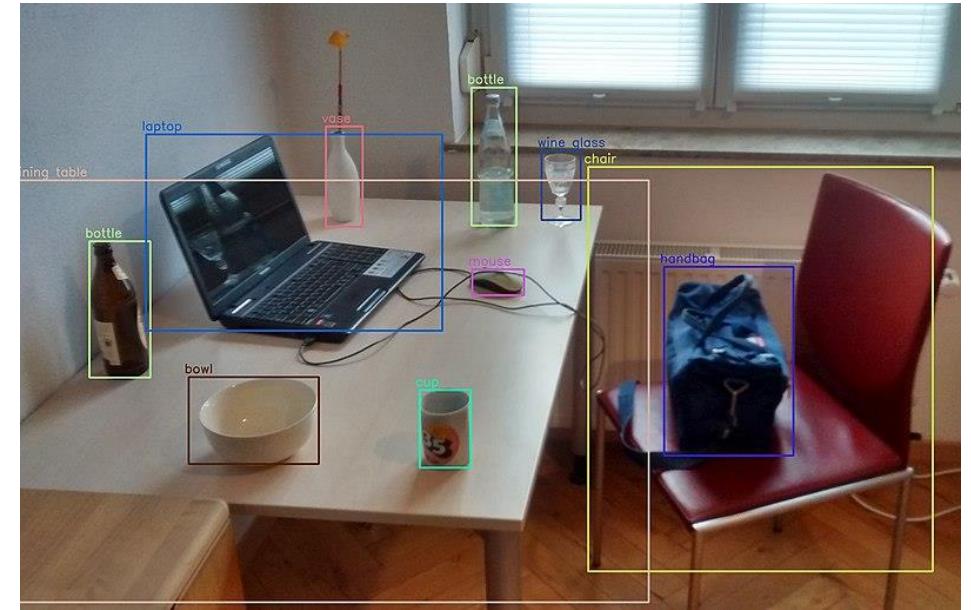

- Can only train on a single machine (CPU or GPU, multi-GPU OK)
 - ml.m5.2xlarge
 - ml.p2.xlarge
 - If needed, go up to ml.m5.4xlarge or ml.m5.12xlarge
- Inference: use ml.p2.2xlarge
 - Use `INFERENCE_PREFERRED_MODE` environment variable to optimize for encoder embeddings rather than classification or regression.

Object Detection

Object Detection: What's it for?

- Identify all objects in an image with bounding boxes
- Detects and classifies objects with a single deep neural network
- Classes are accompanied by confidence scores
- Can train from scratch, or use pre-trained models based on ImageNet

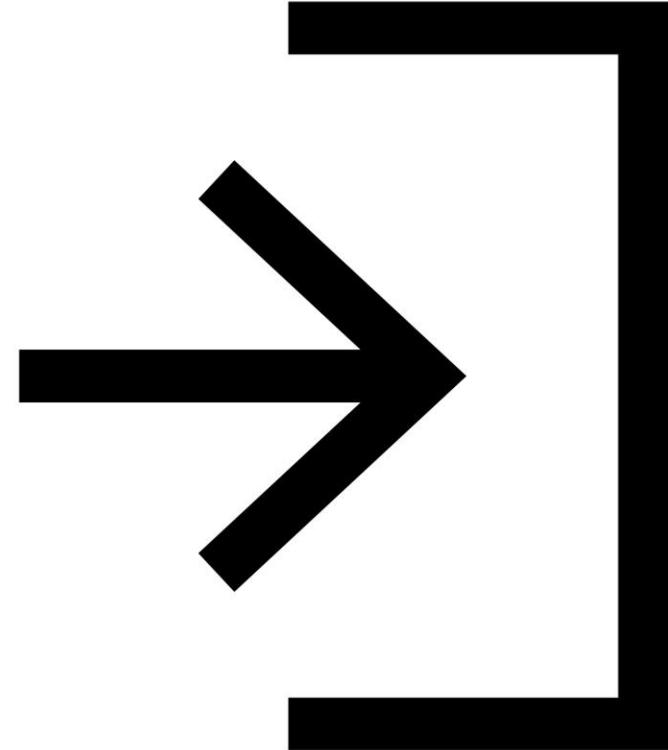

(MTheiler) [CC BY-SA 4.0 (<https://creativecommons.org/licenses/by-sa/4.0/>)]

Object Detection: What training input does it expect?

- RecordIO or image format (jpg or png)
- With image format, supply a JSON file for annotation data for each image

```
{  
  "file": "your_image_directory/sample_image1.jpg",  
  "image_size": [  
    {  
      "width": 500,  
      "height": 400,  
      "depth": 3  
    }  
  ],  
  "annotations": [  
    {  
      "class_id": 0,  
      "left": 111,  
      "top": 134,  
      "width": 61,  
      "height": 128  
    },  
  ],  
  "categories": [  
    {  
      "class_id": 0,  
      "name": "dog"  
    },  
  ]  
}
```

Object Detection: How is it used?

- Takes an image as input, outputs all instances of objects in the image with categories and confidence scores
- Uses a CNN with the Single Shot multibox Detector (SSD) algorithm
 - The base CNN can be VGG-16 or ResNet-50
- Transfer learning mode / incremental training
 - Use a pre-trained model for the base network weights, instead of random initial weights
- Uses flip, rescale, and jitter internally to avoid overfitting

Object Detection: Important Hyperparameters

- Mini_batch_size
- Learning_rate
- Optimizer
 - Sgd, adam, rmsprop, adadelta

Object Detection: Instance Types

- Use GPU instances for training
(multi-GPU and multi-machine OK)
 - ml.p2.xlarge, ml.p2.8xlarge,
ml.p2.16xlarge, ml.p3.2xlarge,
ml.p3.8xlarge, ml.p3.16xlarge
- Use CPU or GPU for inference
 - C5, M5, P2, P3 all OK

Image Classification

Image Classification: What's it for?

- Assign one or more labels to an image
- Doesn't tell you where objects are, just what objects are in the image

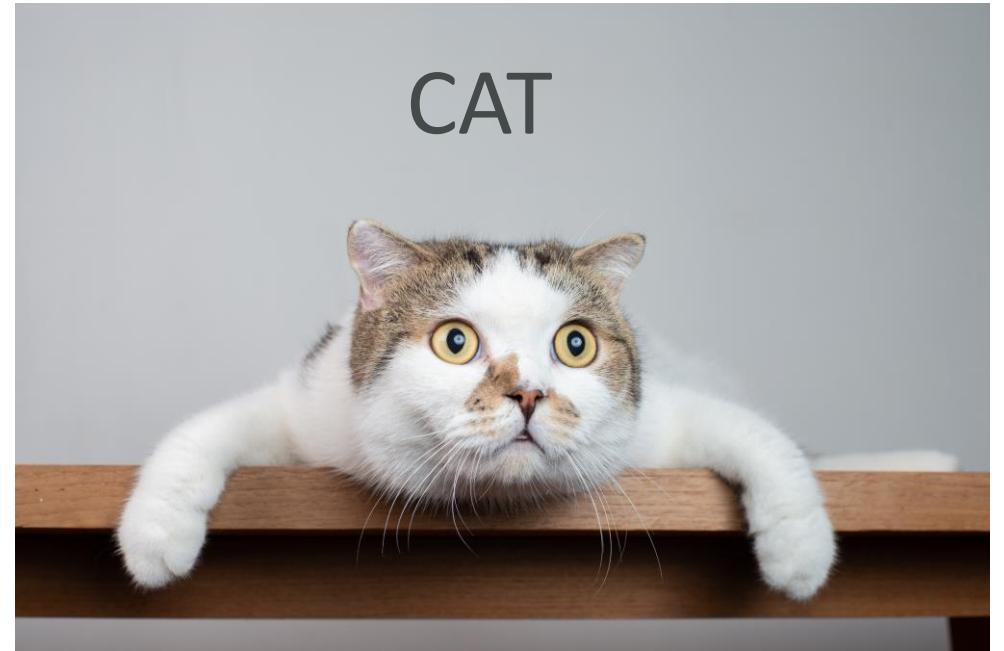

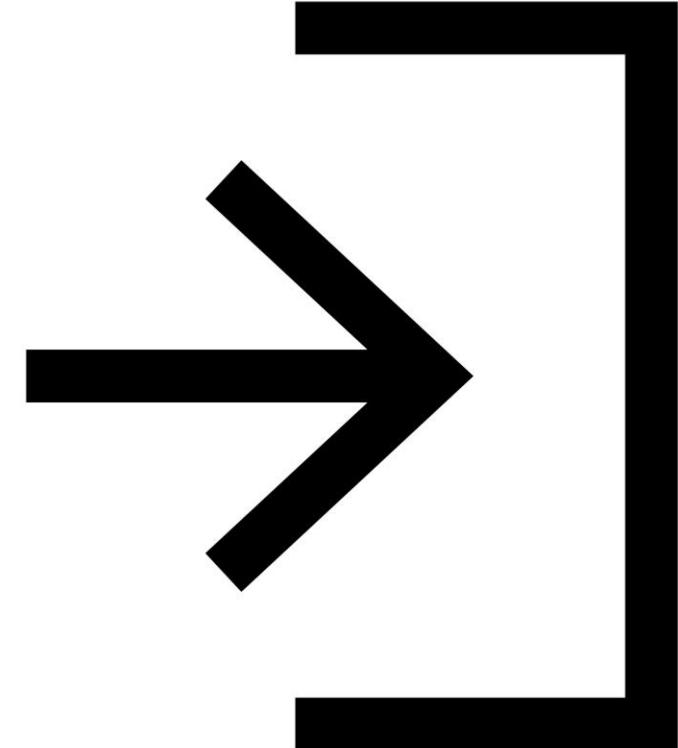

Image Classification: What training input does it expect?

- Apache MXNet RecordIO
 - Not protobuf!
 - This is for interoperability with other deep learning frameworks.
- Or, raw jpg or png images
- Image format requires .lst files to associate image index, class label, and path to the image
- Augmented Manifest Image Format enables Pipe mode

```
5 1 your_image_directory/train_img_dog1.jpg
1000 0 your_image_directory/train_img_cat1.jpg
22 1 your_image_directory/train_img_dog2.jpg
```

```
{"source-ref":"s3://image/filename1.jpg", "class":"0"}
{"source-ref":"s3://image/filename2.jpg", "class":"1", "class-metadata": {"class-name": "cat", "type" : "groundtruth/image-classification"}}
```

Image Classification: How is it used?

- ResNet CNN under the hood
- Full training mode
 - Network initialized with random weights
- Transfer learning mode
 - Initialized with pre-trained weights
 - The top fully-connected layer is initialized with random weights
 - Network is fine-tuned with new training data
- Default image size is 3-channel 224x224 (ImageNet's dataset)

Image Classification: Important Hyperparameters

- The usual suspects for deep learning
 - Batch size, learning rate, optimizer
- Optimizer-specific parameters
 - Weight decay, beta 1, beta 2, eps, gamma

Image Classification: Instance Types

- GPU instances for training (P2, P3)
Multi-GPU and multi-machine OK.
- CPU or GPU for inference (C4, P2, P3)

Semantic Segmentation

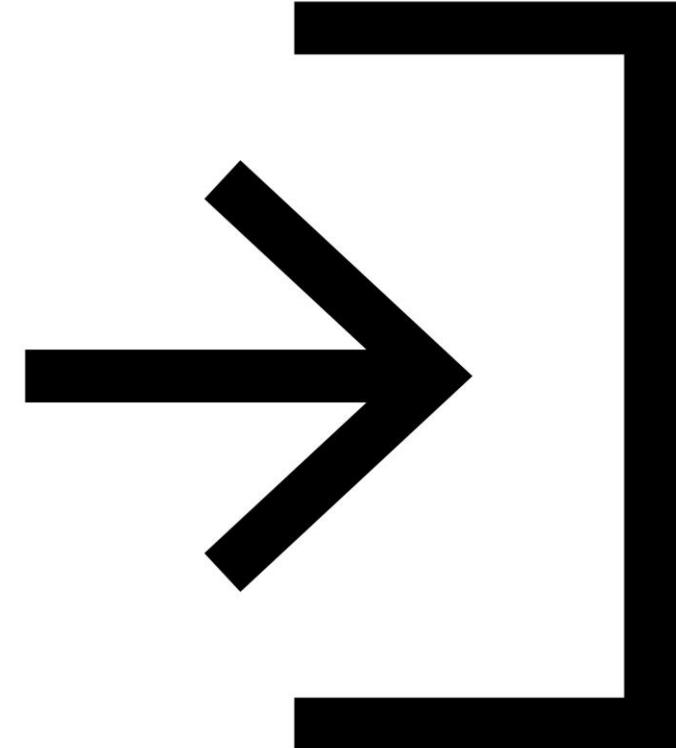

Semantic Segmentation: What's it for?

- Pixel-level object classification
- Different from image classification – that assigns labels to whole images
- Different from object detection – that assigns labels to bounding boxes
- Useful for self-driving vehicles, medical imaging diagnostics, robot sensing
- Produces a *segmentation mask*

Semantic Segmentation: What training input does it expect?

- JPG Images and PNG annotations
- For both training and validation
- Label maps to describe annotations
- Augmented manifest image format supported for Pipe mode.
- JPG images accepted for inference

Semantic Segmentation: How is it used?

- Built on MXNet Gluon and Gluon CV
- Choice of 3 algorithms:
 - Fully-Convolutional Network (FCN)
 - Pyramid Scene Parsing (PSP)
 - DeepLabV3
- Choice of backbones:
 - ResNet50
 - ResNet101
 - Both trained on ImageNet
- Incremental training, or training from scratch, supported too

Semantic Segmentation: Important Hyperparameters

- Epochs, learning rate, batch size, optimizer, etc
- Algorithm
- Backbone

Semantic Segmentation: Instance Types

- Only GPU supported for training (P2 or P3) on a single machine only
 - Specifically ml.p2.xlarge, ml.p2.8xlarge, ml.p2.16xlarge, ml.p3.2xlarge, ml.p3.8xlarge, or ml.p3.16xlarge
- Inference on CPU (C5 or M5) or GPU (P2 or P3)

Random Cut Forest

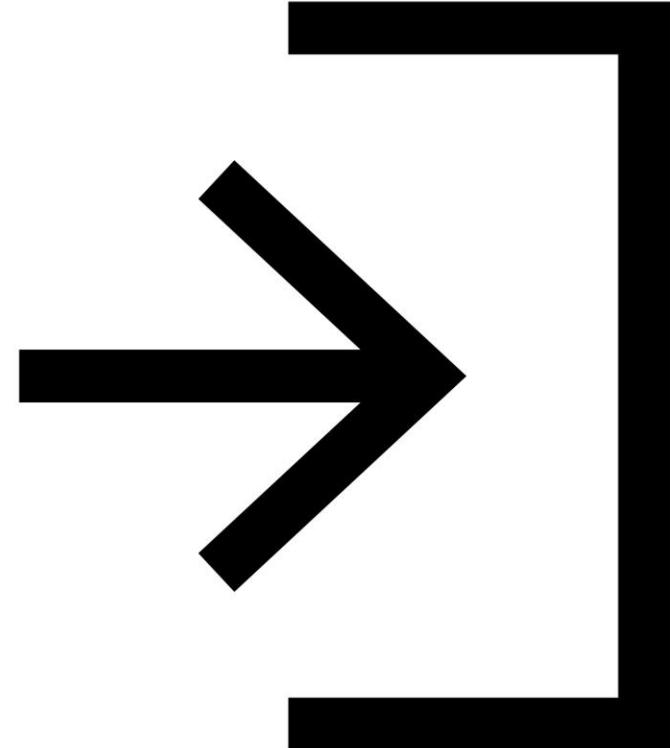

Random Cut Forest: What's it for?

- Anomaly detection
- Unsupervised
- Detect unexpected spikes in time series data
- Breaks in periodicity
- Unclassifiable data points
- Assigns an anomaly score to each data point
- Based on an algorithm developed by Amazon that they seem to be very proud of!

Random Cut Forest: What training input does it expect?

- RecordIO-protobuf or CSV
- Can use File or Pipe mode on either
- Optional test channel for computing accuracy, precision, recall, and F1 on labeled data (anomaly or not)

Random Cut Forest: How is it used?

- Creates a forest of trees where each tree is a partition of the training data; looks at expected change in complexity of the tree as a result of adding a point into it
- Data is sampled randomly
- Then trained
- RCF shows up in Kinesis Analytics as well; it can work on streaming data too.

Random Cut Forest: Important Hyperparameters

- Num_trees
 - Increasing reduces noise
- Num_samples_per_tree
 - Should be chosen such that $1/\text{num_samples_per_tree}$ approximates the ratio of anomalous to normal data

Random Cut Forest: Instance Types

- Does not take advantage of GPUs
- Use M4, C4, or C5 for training
- ml.c5.xl for inference

Neural Topic Model

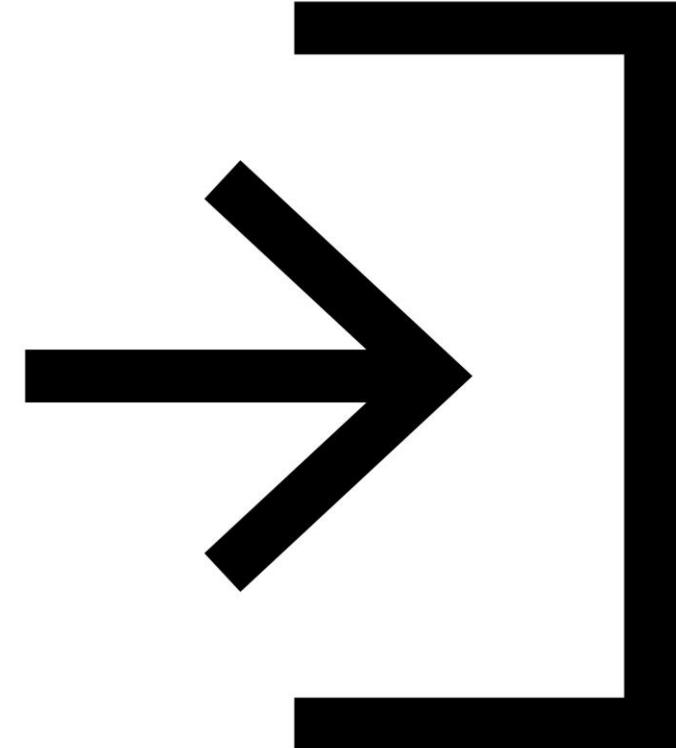

Neural Topic Model: What's it for?

- Organize documents into topics
- Classify or summarize documents based on topics
- It's not just TF/IDF
 - "bike", "car", "train", "mileage", and "speed" might classify a document as "transportation" for example (although it wouldn't know to call it that)
- Unsupervised
 - Algorithm is "Neural Variational Inference"

Neural Topic Model: What training input does it expect?

- Four data channels
 - “train” is required
 - “validation”, “test”, and “auxiliary” optional
- recordIO-protobuf or CSV
- Words must be tokenized into integers
 - Every document must contain a count for every word in the vocabulary in CSV
 - The “auxiliary” channel is for the vocabulary
- File or pipe mode

Neural Topic Model: How is it used?

- You define how many topics you want
- These topics are a latent representation based on top ranking words
- One of two topic modeling algorithms in SageMaker – you can try them both!

Neural Topic Model: Important Hyperparameters

- Lowering `mini_batch_size` and `learning_rate` can reduce validation loss
 - At expense of training time
- `Num_topics`

Neural Topic Model: Instance Types

- GPU or CPU
 - GPU recommended for training
 - CPU OK for inference
 - CPU is cheaper

LDA

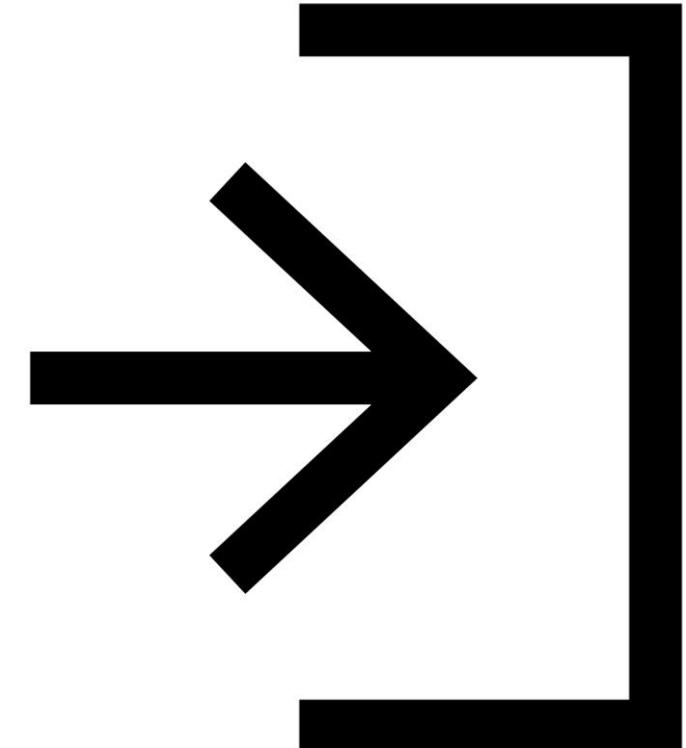

LDA: What's it for?

- Latent Dirichlet Allocation
- Another topic modeling algorithm
 - Not deep learning
- Unsupervised
 - The topics themselves are unlabeled; they are just groupings of documents with a shared subset of words
- Can be used for things other than words
 - Cluster customers based on purchases
 - Harmonic analysis in music

LDA: What training input does it expect?

- Train channel, optional test channel
- recordIO-protobuf or CSV
- Each document has counts for every word in vocabulary (in CSV format)
- Pipe mode only supported with recordIC

LDA: How is it used?

- Unsupervised; generates however many topics you specify
- Optional test channel can be used for scoring results
 - Per-word log likelihood
- Functionally similar to NTM, but CPU-based
 - Therefore maybe cheaper / more efficient

LDA: Important Hyperparameters

- Num_topics
- Alpha0
 - Initial guess for concentration parameter
 - Smaller values generate sparse topic mixtures
 - Larger values (>1.0) produce uniform mixtures

LDA: Instance Types

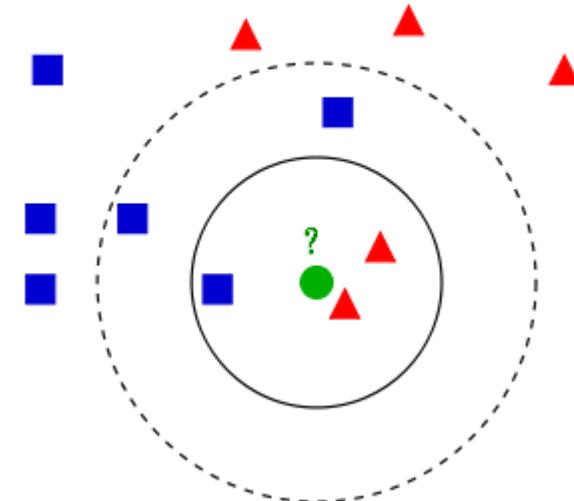

- Single-instance CPU training

KNN

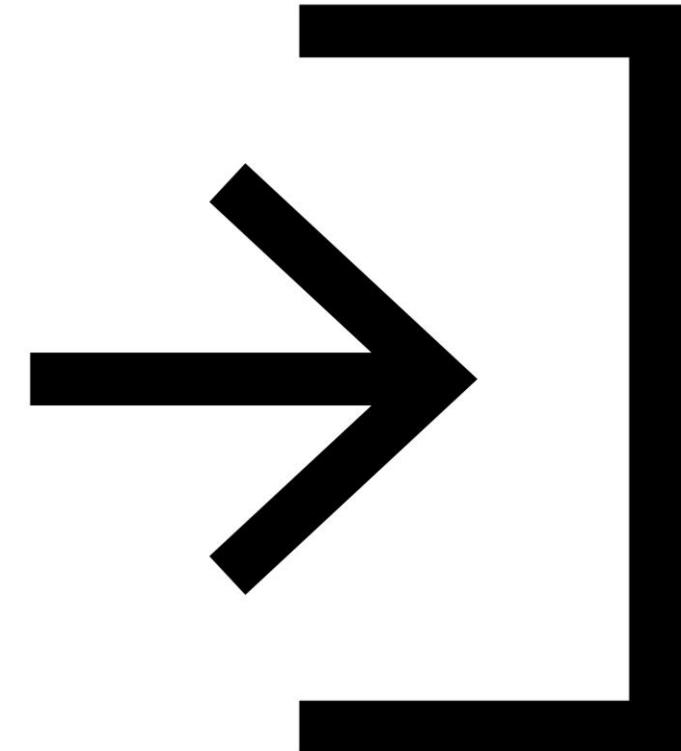

KNN: What's it for?

- K-Nearest-Neighbors
- Simple classification or regression algorithm
- Classification
 - Find the K closest points to a sample point and return the most frequent label
- Regression
 - Find the K closest points to a sample point and return the average value

KNN: What training input does it expect?

- Train channel contains your data
- Test channel emits accuracy or MSE
- recordIO-protobuf or CSV training
 - First column is label
- File or pipe mode on either

KNN: How is it used?

- Data is first sampled
- SageMaker includes a dimensionality reduction stage
 - Avoid sparse data (“curse of dimensionality”)
 - At cost of noise / accuracy
 - “sign” or “fjlt” methods
- Build an index for looking up neighbors
- Serialize the model
- Query the model for a given K

KNN: Important Hyperparameters

- K!
- Sample_size

KNN: Instance Types

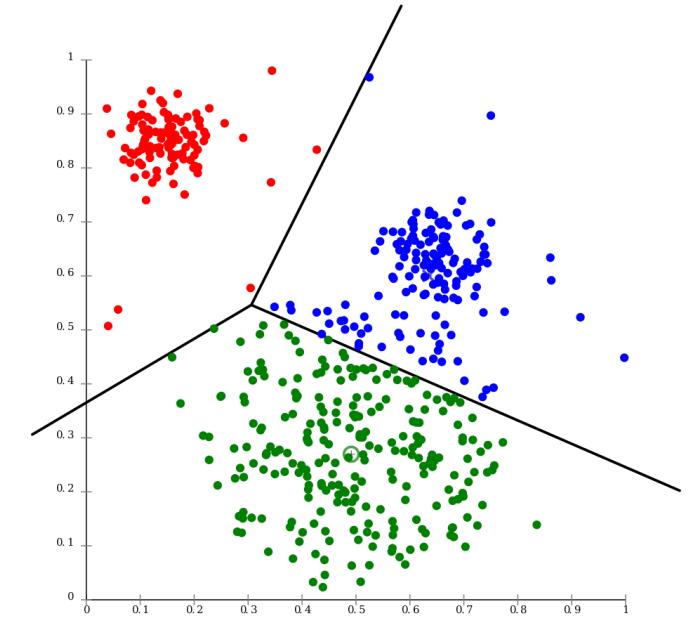

- Training on CPU or GPU
 - MI.m5.2xlarge
 - MI.p2.xlarge
- Inference
 - CPU for lower latency
 - GPU for higher throughput on large batches

K-Means

K-Means: What's it for?

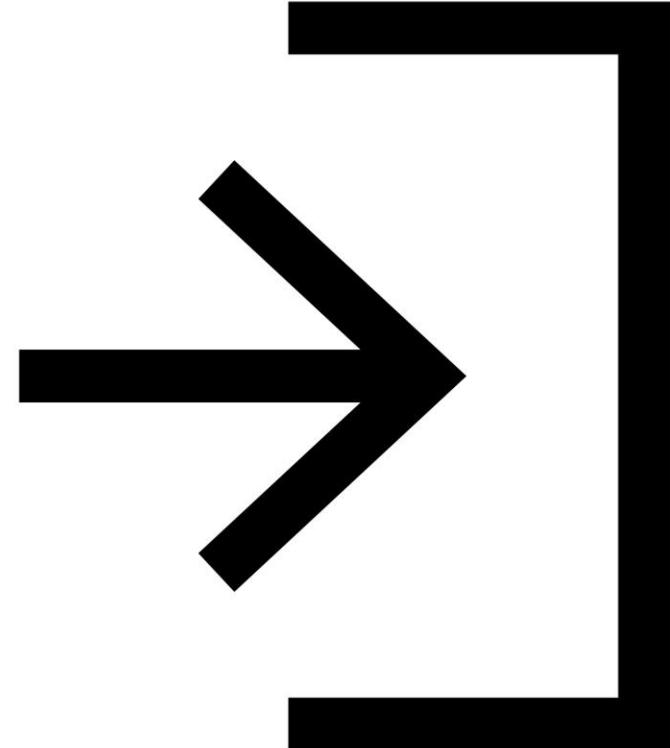

- Unsupervised clustering
- Divide data into K groups, where members of a group are as similar as possible to each other
 - You define what “similar” means
 - Measured by Euclidean distance
- Web-scale K-Means clustering

Chire [CC BY-SA 3.0 (<https://creativecommons.org/licenses/by-sa/3.0>)]

K-Means: What training input does it expect?

- Train channel, optional test
 - Train ShardedByS3Key, test FullyReplicate
- recordIO-protobuf or CSV
- File or Pipe on either

K-Means: How is it used?

- Every observation mapped to n-dimensional space (n = number of features)
- Works to optimize the center of K clusters
 - “extra cluster centers” may be specified to improve accuracy (which end up getting reduced to k)
 - $K = k^*x$
- Algorithm:
 - Determine initial cluster centers
 - Random or k-means++ approach
 - K-means++ tries to make initial clusters far apart
 - Iterate over training data and calculate cluster centers
 - Reduce clusters from K to k
 - Using Lloyd’s method with kmeans++

K-Means: Important Hyperparameters

- K!
 - Choosing K is tricky
 - Plot within-cluster sum of squares as function of K
 - Use “elbow method”
 - Basically optimize for tightness of clusters
- Mini_batch_size
- Extra_center_factor
- Init_method

K-Means: Instance Types

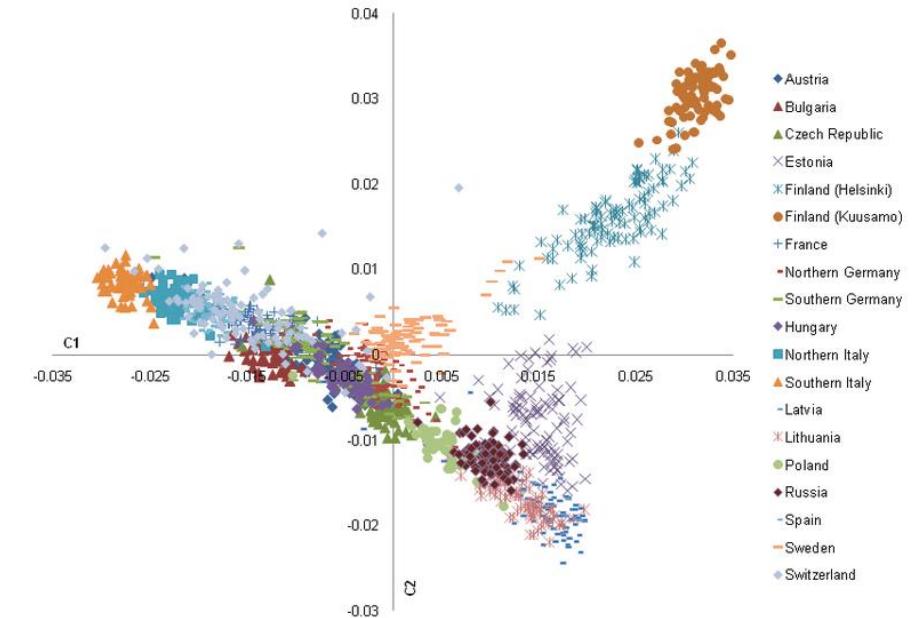

- CPU or GPU, but CPU recommended
 - Only one GPU per instance used on GPU
 - So use p*.xlarge if you're going to use GPU

PCA

PCA: What's it for?

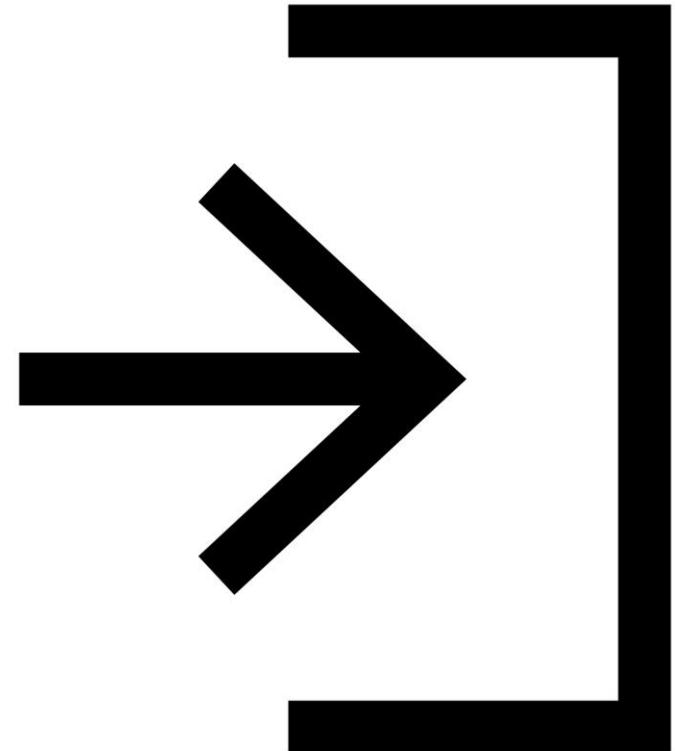

- Principal Component Analysis
- Dimensionality reduction
 - Project higher-dimensional data (lots of features) into lower-dimensional (like a 2D plot) while minimizing loss of information
 - The reduced dimensions are called components
 - First component has largest possible variability
 - Second component has the next largest...
- Unsupervised

Nelis M, Esko T, Ma“gi R, Zimprich F, Zimprich A, et al. (2009) [CC BY 2.5
(<https://creativecommons.org/licenses/by/2.5>)]

PCA: What training input does it expect?

- recordIO-protobuf or CSV
- File or Pipe on either

PCA: How is it used?

- Covariance matrix is created, then singular value decomposition (SVD)
- Two modes
 - Regular
 - For sparse data and moderate number of observations and features
 - Randomized
 - For large number of observations and features
 - Uses approximation algorithm

PCA: Important Hyperparameters

- Algorithm_mode
- Subtract_mean
 - Unbias data

PCA: Instance Types

- GPU or CPU
 - It depends “on the specifics of the input data”

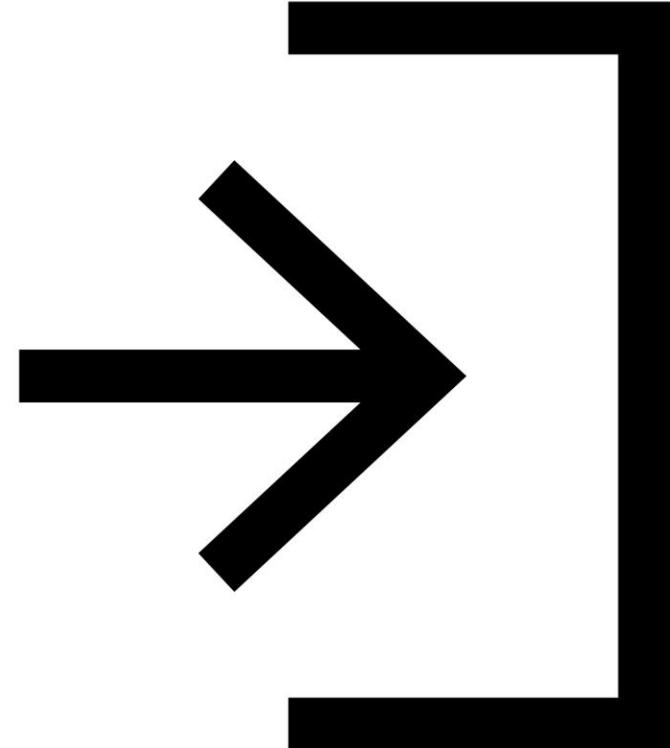

Factorization Machines

Factorization Machines: What's it for?

- Dealing with sparse data
 - Click prediction
 - Item recommendations
 - Since an individual user doesn't interact with most pages / products the data is sparse
- Supervised
 - Classification or regression
- Limited to pair-wise interactions
 - User -> item for example

Factorization Machines: What training input does it expect?

- recordIO-protobuf with Float32
 - Sparse data means CSV isn't practical

Factorization Machines: How is it used?

- Finds factors we can use to predict a classification (click or not? Purchase or not?) or value (predicted rating?) given a matrix representing some pair of things (users & items?)
- Usually used in the context of recommender systems

Factorization Machines: Important Hyperparameters

- Initialization methods for bias, factors, and linear terms
 - Uniform, normal, or constant
 - Can tune properties of each method

Factorization Machines: Instance Types

- CPU or GPU
 - CPU recommended
 - GPU only works with dense data

IP Insights

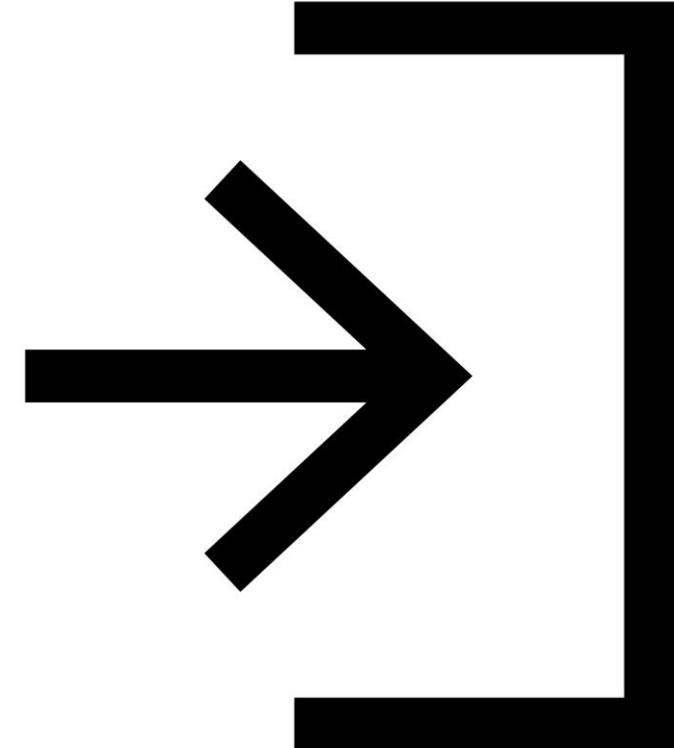

IP Insights: What's it for?

- Unsupervised learning of IP address usage patterns
- Identifies suspicious behavior from IP addresses
 - Identify logins from anomalous IP's
 - Identify accounts creating resources from anomalous IP's

IP Insights: What training input does it expect?

- User names, account ID's can be fed in directly; no need to pre-process
- Training channel, optional validation (computes AUC score)
- CSV only
 - Entity, IP

IP Insights: How is it used?

- Uses a neural network to learn latent vector representations of entities and IP addresses.
- Entities are hashed and embedded
 - Need sufficiently large hash size
- Automatically generates negative samples during training by randomly pairing entities and IP's

IP Insights: Important Hyperparameters

- Num_entity_vectors
 - Hash size
 - Set to twice the number of unique entity identifiers
- Vector_dim
 - Size of embedding vectors
 - Scales model size
 - Too large results in overfitting
- Epochs, learning rate, batch size, etc.

IP Insights: Instance Types

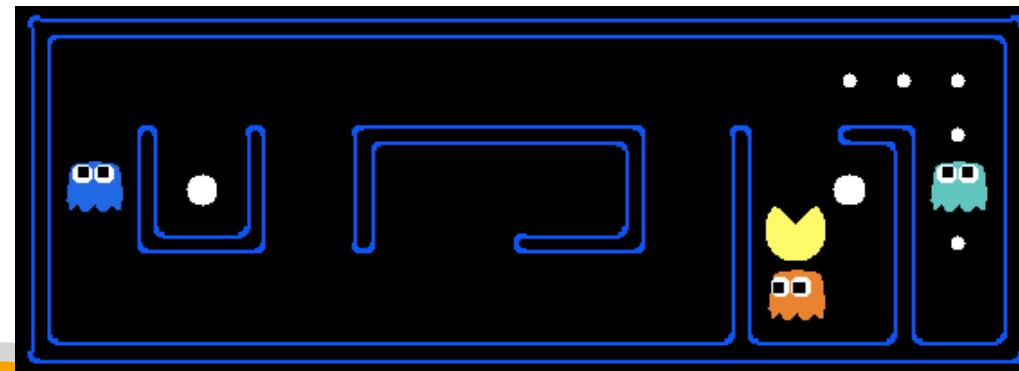

- CPU or GPU
 - GPU recommended
 - Ml.p3.2xlarge or higher
 - Can use multiple GPU's
 - Size of CPU instance depends on vector_dim and num_entity_vectors

Reinforcement Learning

Reinforcement Learning

- You have some sort of agent that “explores” some space
- As it goes, it learns the value of different state changes in different conditions
- Those values inform subsequent behavior of the agent
- Examples: Pac-Man, Cat & Mouse game (game AI)
 - Supply chain management
 - HVAC systems
 - Industrial robotics
 - Dialog systems
 - Autonomous vehicles
- Yields fast on-line performance once the space has been explored

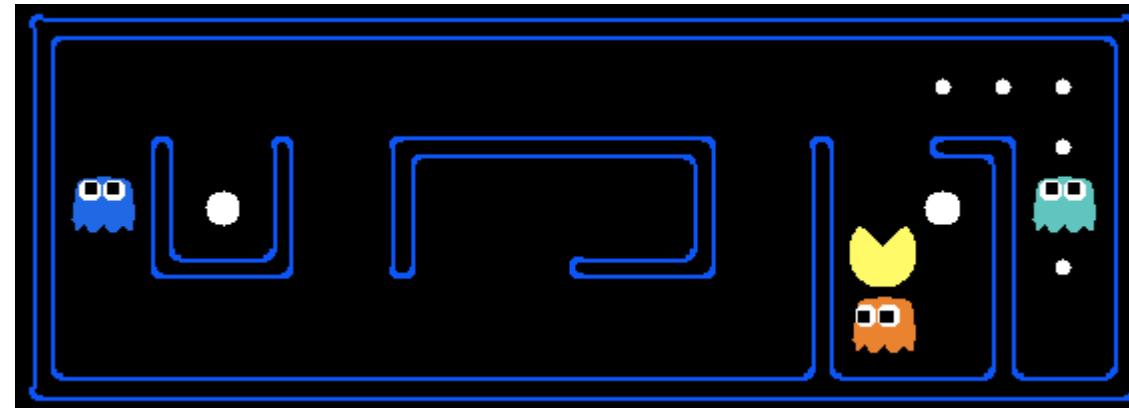

Q-Learning

- A specific implementation of reinforcement learning
- You have:
 - A set of environmental states s
 - A set of possible actions in those states a
 - A value of each state/action Q
- Start off with Q values of 0
- Explore the space
- As bad things happen after a given state/action, reduce its Q
- As rewards happen after a given state/action, increase its Q

$Q(s, a) += \text{alpha} * (\text{reward}(s,a) + \max(Q(s')) - Q(s,a))$ where s is the previous state, a is the previous action, s' is the current state, and alpha is the discount factor (set to .5 here).

Q-Learning

- What are some state/actions here?
 - Pac-man has a wall to the West
 - Pac-man dies if he moves one step South
 - Pac-man just continues to live if going North or East
- You can “look ahead” more than one step by using a discount factor when computing Q (here s is previous state, s’ is current state)
 - $Q(s,a) += \text{discount} * (\text{reward}(s,a) + \max(Q(s')) - Q(s,a))$

The exploration problem

- How do we efficiently explore all of the possible states?
 - Simple approach: always choose the action for a given state with the highest Q. If there's a tie, choose at random
 - But that's really inefficient, and you might miss a lot of paths that way
 - Better way: introduce an epsilon term
 - If a random number is less than epsilon, don't follow the highest Q, but choose at random
 - That way, exploration never totally stops
 - Choosing epsilon can be tricky

Fancy Words

- Markov Decision Process
 - From Wikipedia: **Markov decision processes (MDPs)** provide a mathematical framework for modeling decision making in situations where outcomes are partly random and partly under the control of a decision maker.
 - Sound familiar? MDP's are just a way to describe what we just did using mathematical notation.
 - States are still described as s and s'
 - State transition functions are described as $P_a(s, s')$
 - Our "Q" values are described as a reward function $R_a(s, s')$
- Even fancier words! An MDP is a *discrete time stochastic control process*.

So to recap

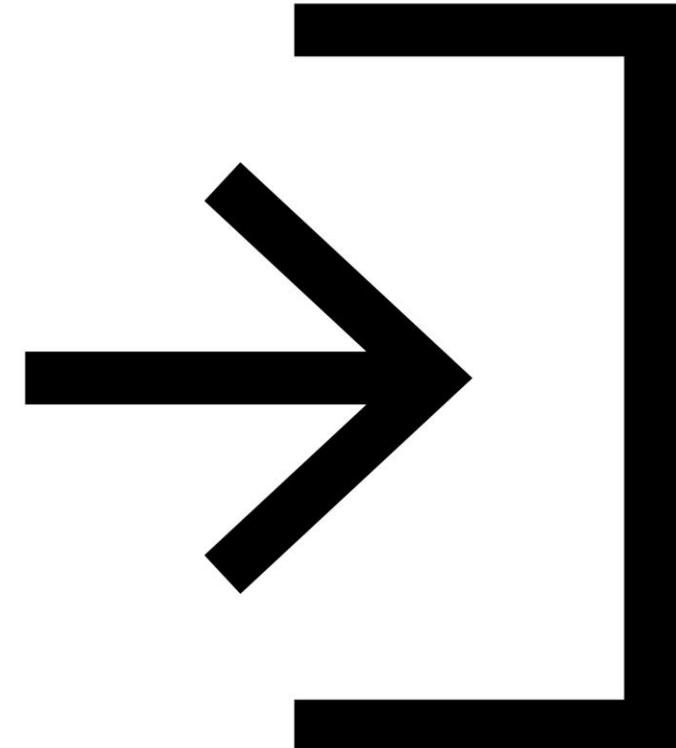

- You can make an intelligent Pac-Man in a few steps:
 - Have it semi-randomly explore different choices of movement (actions) given different conditions (states)
 - Keep track of the reward or penalty associated with each choice for a given state/action (Q)
 - Use those stored Q values to inform its future choices
- Pretty simple concept. But hey, now you can say you understand reinforcement learning, Q-learning, Markov Decision Processes, and Dynamic Programming!

Reinforcement Learning in SageMaker

- Uses a deep learning framework with Tensorflow and MXNet
- Supports Intel Coach and Ray Rllib toolkits.
- Custom, open-source, or commercial environments supported.
 - MATLAB, Simulink
 - EnergyPlus, RoboSchool, PyBullet
 - Amazon Sumerian, AWS RoboMaker

Distributed Training with SageMaker RL

- Can distribute training and/or environment rollout
- Multi-core and multi-instance

Reinforcement Learning: Key Terms

- Environment
 - The layout of the board / maze / etc
- State
 - Where the player / pieces are
- Action
 - Move in a given direction, etc
- Reward
 - Value associated with the action from that state
- Observation
 - i.e., surroundings in a maze, state of chess board

Reinforcement Learning: Hyperparameter Tuning

- Parameters of your choosing may be abstracted
- Hyperparameter tuning in SageMaker can then optimize them

Reinforcement Learning: Instance Types

- No specific guidance given in developer guide
- But, it's deep learning – so GPU's are helpful
- And we know it supports multiple instances and cores

Automatic Model Tuning

With SageMaker

Hyperparameter tuning

- How do you know the best values of learning rate, batch size, depth, etc?
- Often you have to experiment
- Problem blows up quickly when you have many different hyperparameters; need to try every combination of every possible value somehow, train a model, and evaluate it every time

Automatic Model Tuning

- Define the hyperparameters you care about and the ranges you want to try, and the metrics you are optimizing for
- SageMaker spins up a “HyperParameter Tuning Job” that trains as many combinations as you’ll allow
 - Training instances are spun up as needed, potentially a lot of them
- The set of hyperparameters producing the best results can then be deployed as a model
- **It learns as it goes**, so it doesn’t have to try every possible combination

Automatic Model Tuning: Best Practices

- Don't optimize too many hyperparameters at once
- Limit your ranges to as small a range as possible
- Use logarithmic scales when appropriate
- Don't run too many training jobs concurrently
 - This limits how well the process can learn as it goes
- Make sure training jobs running on multiple instances report the correct objective metric in the end

SageMaker and Spark

Integrating SageMaker and Spark

- Pre-process data as normal with Spark
 - Generate DataFrames
- Use sagemaker-spark library
- SageMakerEstimator
 - KMeans, PCA, XGBoost
- SageMakerModel

Create And Invoke Model

The IAM role specified in `iam_role` is passed to the containers SageMaker uses for model hosting allowing them to do things like publish CloudWatch metrics and download data from S3. If you are unsure of which policies to add to this role try adding the managed `AmazonSageMakerFullAccess` and scoping down permissions from there if needed.

Takes ~10-20 minutes

```
In [ ]: from sagemaker_pyspark import IAMRole
from sagemaker_pyspark.algorithms import XGBoostSageMakerEstimator

iam_role = "name_of_your_iam_role"

xgboost_estimator = XGBoostSageMakerEstimator(
    trainingInstanceType="ml.m4.xlarge",
    trainingInstanceCount=1,
    endpointInstanceType="ml.m4.xlarge",
    endpointInitialInstanceCount=1,
    sagemakerRole=IAMRole(iam_role))

xgboost_estimator.setNumRound(25) # Set number of trees to use
xgboost_estimator.setNumClasses(10) # MNIST contains digits 0-9
xgboost_estimator.setObjective('multi:softmax') # Set XGBoost objective to multi-class classification w/ SoftMax

xgboost_model = xgboost_estimator.fit(training_data)

transformed_data = xgboost_model.transform(test_data.limit(5)) # Score first 5 rows of test data
transformed_data.show()
```

Create And Invoke Model From An Existing Endpoint

In the last step we saw how you can create and train a model then invoke it from the model object. Here we create the model object from an existing SageMaker endpoint and use invoke it for scoring on the same test data.

```
In [8]: from sagemaker_pyspark import SageMakerModel, EndpointCreationPolicy
from sagemaker_pyspark.transformation.serializers import LibSVMRequestRowSerializer
from sagemaker_pyspark.transformation.deserializers import XGBoostCSVRowDeserializer

my_endpoint = xgboost_model.endpointName # Get endpoint name of model created in previous step

xgboost_model = SageMakerModel(
    endpointInstanceType=None,
    endpointInitialInstanceCount=None,
    requestRowSerializer=LibSVMRequestRowSerializer(),
    responseRowDeserializer=XGBoostCSVRowDeserializer(),
    existingEndpointName=my_endpoint,
    endpointCreationPolicy=EndpointCreationPolicy.DO_NOT_CREATE
)
```

Integrating SageMaker and Spark

- Connect notebook to a remote EMR cluster running Spark (or use Zeppelin)
- Training dataframe should have:
 - A features column that is a vector of Doubles
 - An optional labels column of Doubles
- Call fit on your SageMakerEstimator to get a SageMakerModel
- Call transform on the SageMakerModel to make inferences
- Works with Spark Pipelines as well.

```
val estimator = new KMeansSageMakerEstimator(  
    sagemakerRole = IAMRole(roleArn),  
    trainingInstanceType = "ml.p2.xlarge",  
    trainingInstanceCount = 1,  
    endpointInstanceType = "ml.c4.xlarge",  
    endpointInitialInstanceCount = 1)  
    .setK(10).setFeatureDim(784)  
// train  
val model = estimator.fit(trainingData)  
val transformedData = model.transform(testData)  
transformedData.show
```

Why bother?

- Allows you to combine pre-processing big data in Spark with training and inference in SageMaker.

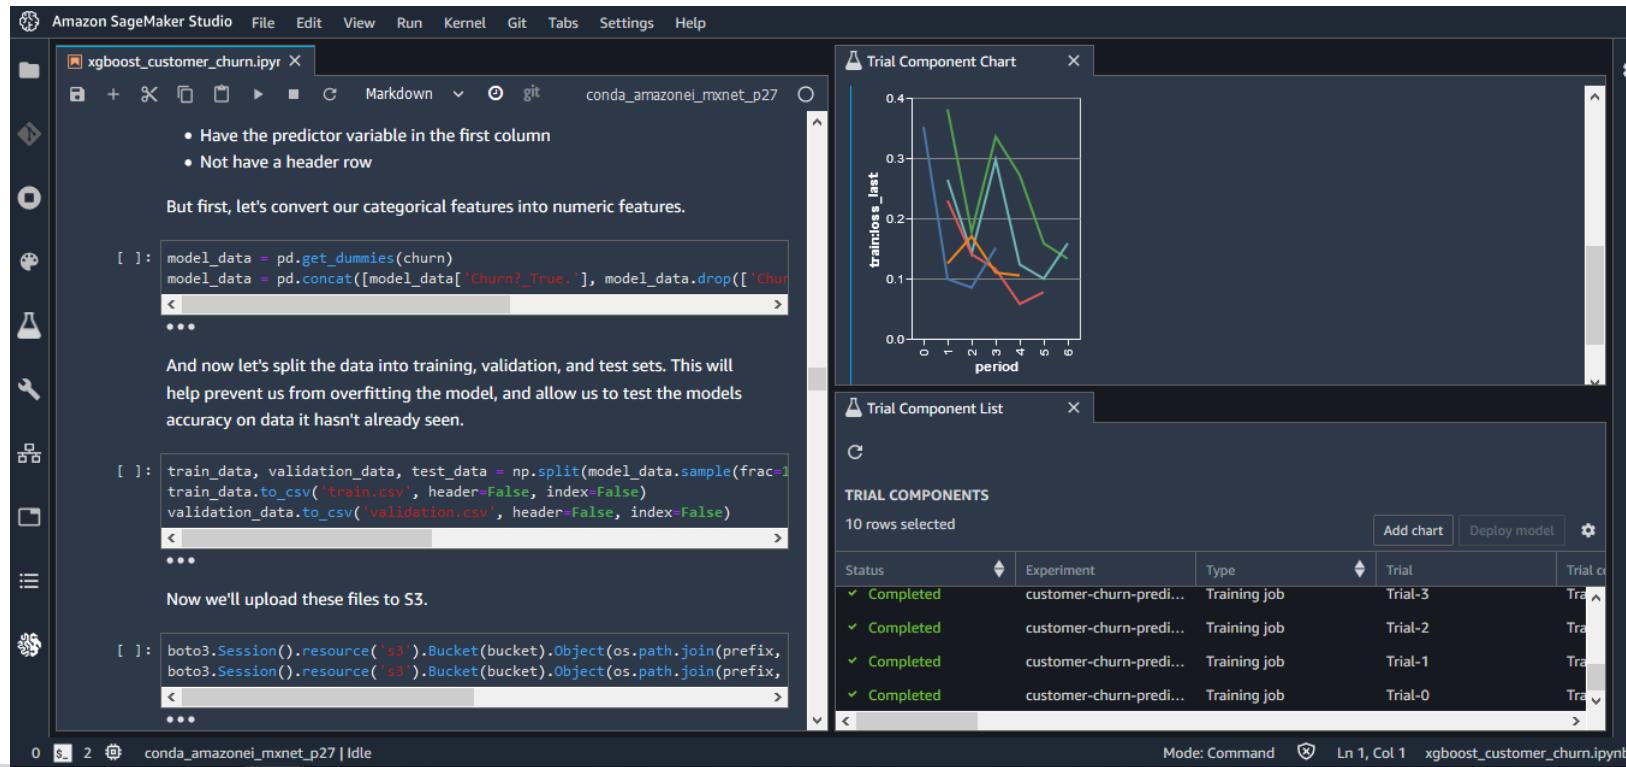

New SageMaker Features

For 2020, 2021 and Beyond

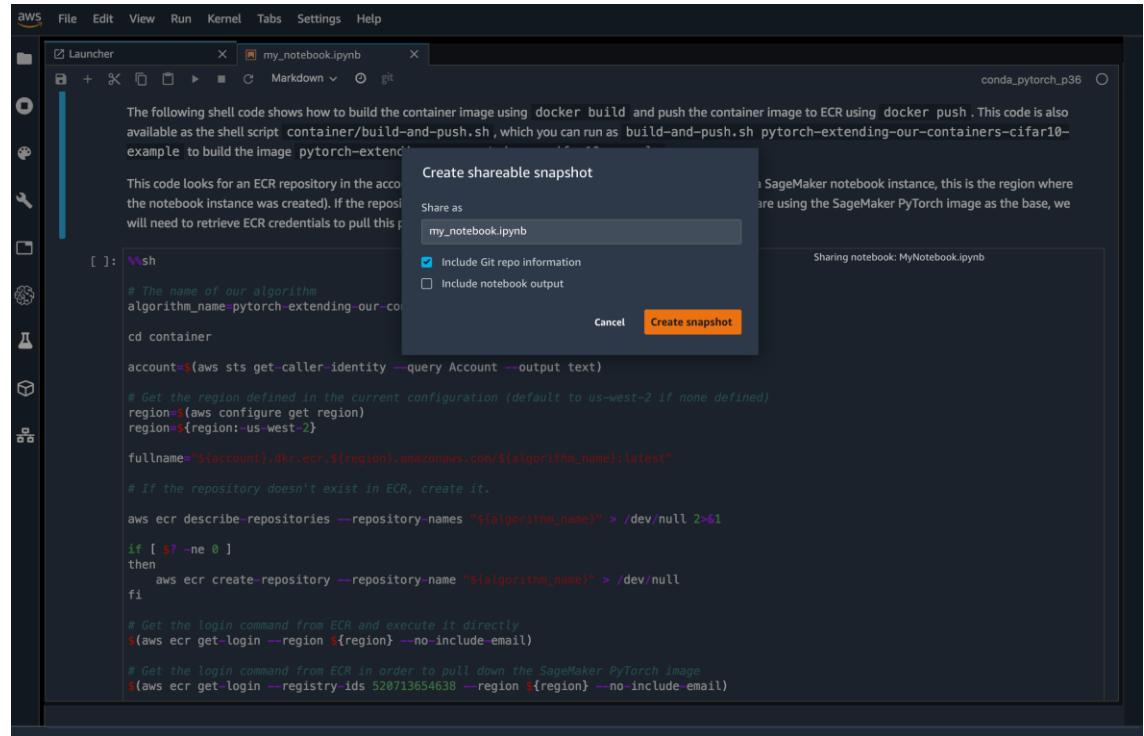

SageMaker Studio

- Visual IDE for machine learning!
- Integrates many of the features we're about to cover.

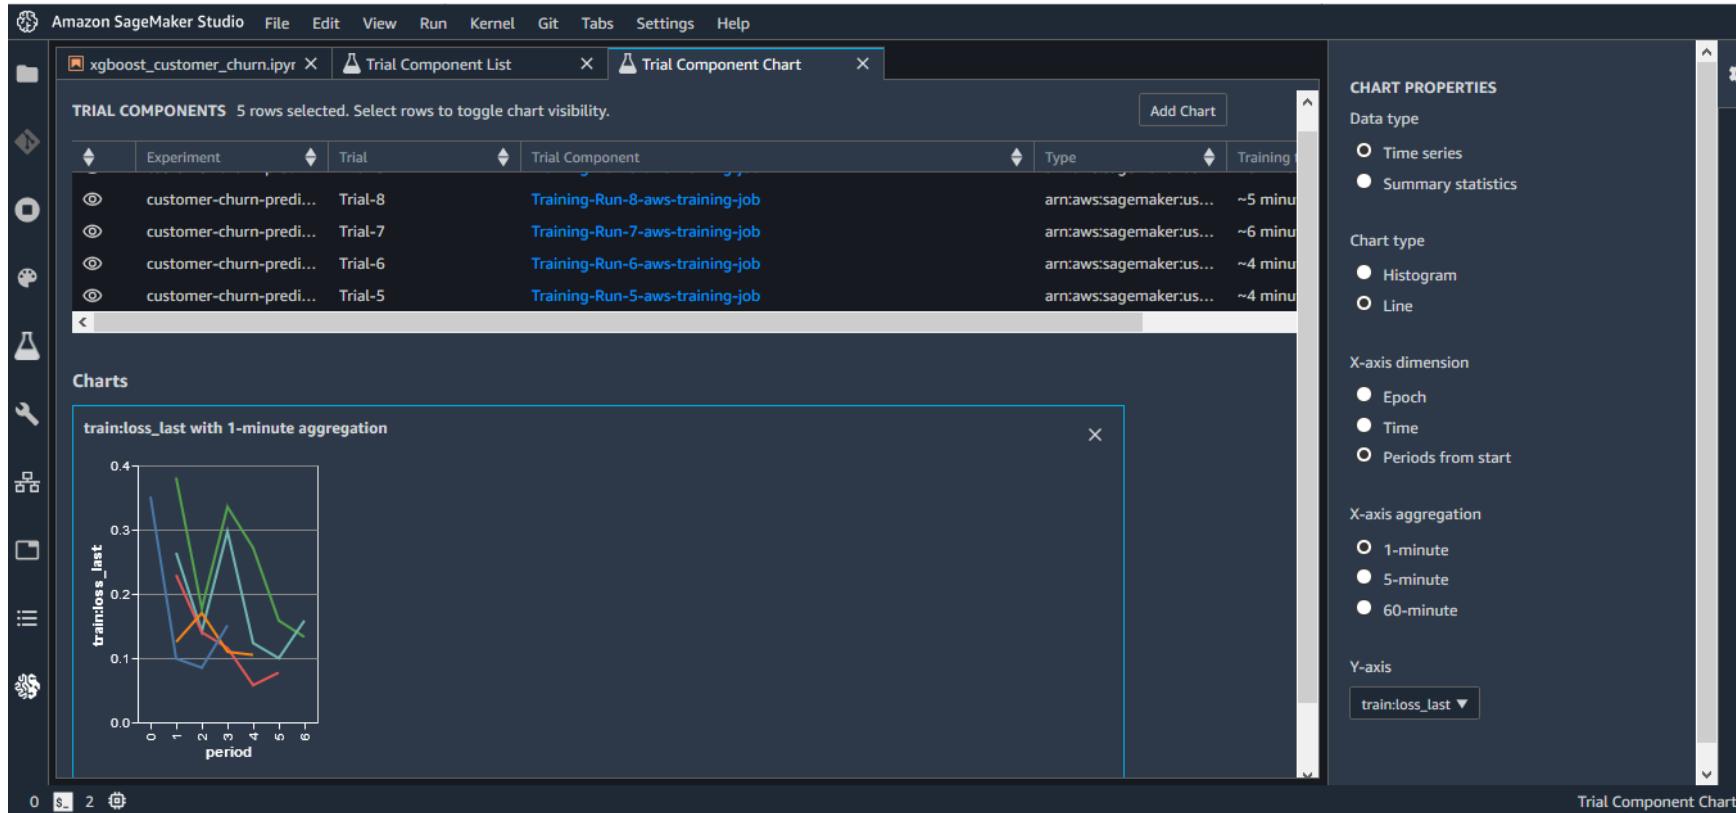

SageMaker Notebooks

- Create and share Jupyter notebooks with SageMaker Studio
- Switch between hardware configurations (no infrastructure to manage)

SageMaker Experiments

- Organize, capture, compare, and search your ML jobs

SageMaker Debugger

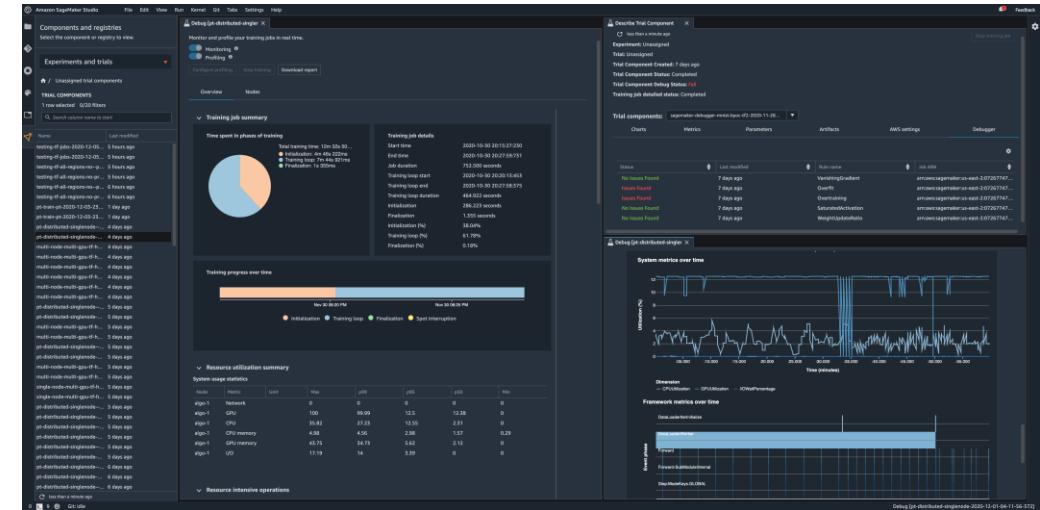

- Saves internal model state at periodical intervals
 - Gradients / tensors over time as a model is trained
 - Define rules for detecting unwanted conditions while training
 - A debug job is run for each rule you configure
 - Logs & fires a CloudWatch event when the rule is hit
- SageMaker Studio Debugger dashboards
- Auto-generated training reports
- Built-in rules:
 - Monitor system bottlenecks
 - Profile model framework operations
 - Debug model parameters

SageMaker Debugger

- Supported Frameworks & Algorithms:
 - Tensorflow
 - PyTorch
 - MXNet
 - XGBoost
 - SageMaker generic estimator (for use with custom training containers)
- Debugger API's available in GitHub
 - Construct hooks & rules for CreateTrainingJob and DescribeTrainingJob API's
 - SMDebug client library lets you register hooks for accessing training data

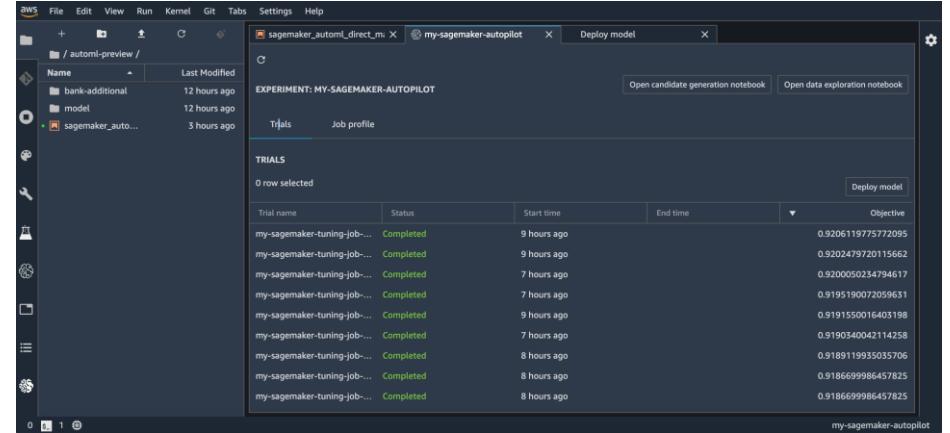

Even Newer SageMaker Debugger Features

- SageMaker Debugger Insights Dashboard
- Debugger ProfilerRule
 - ProfilerReport
 - Hardware system metrics (CPUBottleneck, GPUMemoryIncrease, etc)
 - Framework Metrics (MaxInitializationTime, OverallFrameworkMetrics, StepOutlier)
- Built-in actions to receive notifications or stop training
 - StopTraining(), Email(), or SMS()
 - In response to Debugger Rules
 - Sends notifications via SNS
- Profiling system resource usage and training

SageMaker Autopilot

- Automates:
 - Algorithm selection
 - Data preprocessing
 - Model tuning
 - All infrastructure
- It does all the trial & error for you
- More broadly this is called AutoML

SageMaker Autopilot workflow

- Load data from S3 for training
- Select your target column for prediction
- Automatic model creation
- Model notebook is available for visibility & control
- Model leaderboard
 - Ranked list of recommended models
 - You can pick one
- Deploy & monitor the model, refine via notebook if needed

Do you want to run a complete experiment?

Yes

No, run a pilot to create a notebook with candidate definitions

SageMaker Autopilot

- Can add in human guidance
- With or without code in SageMaker Studio or AWS SDK's
- Problem types:
 - Binary classification
 - Multiclass classification
 - Regression
- Algorithm Types:
 - Linear Learner
 - XGBoost
 - Deep Learning (MLP's)
- Data must be tabular CSV

Autopilot Explainability

- Integrates with SageMaker Clarify
- Transparency on how models arrive at predictions
- Feature attribution
 - Uses SHAP Baselines / Shapley Values
 - Research from cooperative game theory
 - Assigns each feature an importance value for a given prediction

A Unified Approach to Interpreting Model Predictions

Abstract

Understanding why a model makes a certain prediction can be as crucial as the prediction's accuracy in many applications. However, the highest accuracy for large modern datasets is often achieved by complex models that even experts struggle to interpret, such as ensemble or deep learning models, creating a tension between *accuracy* and *interpretability*. In response, various methods have recently been proposed to help users interpret the predictions of complex models, but it is often unclear how these methods are related and when one method is preferable over another. To address this problem, we present a unified framework for interpreting predictions, SHAP (SHapley Additive exPlanations). SHAP assigns each feature an importance value for a particular prediction. Its novel components include: (1) the identification of a new class of additive feature importance measures, and (2) theoretical results showing there is a unique solution in this class with a set of desirable properties. The new class unifies six existing methods, notable because several recent methods in the class lack the proposed desirable properties. Based on insights from this unification, we present new methods that show improved computational performance and/or better consistency with human intuition than previous approaches.

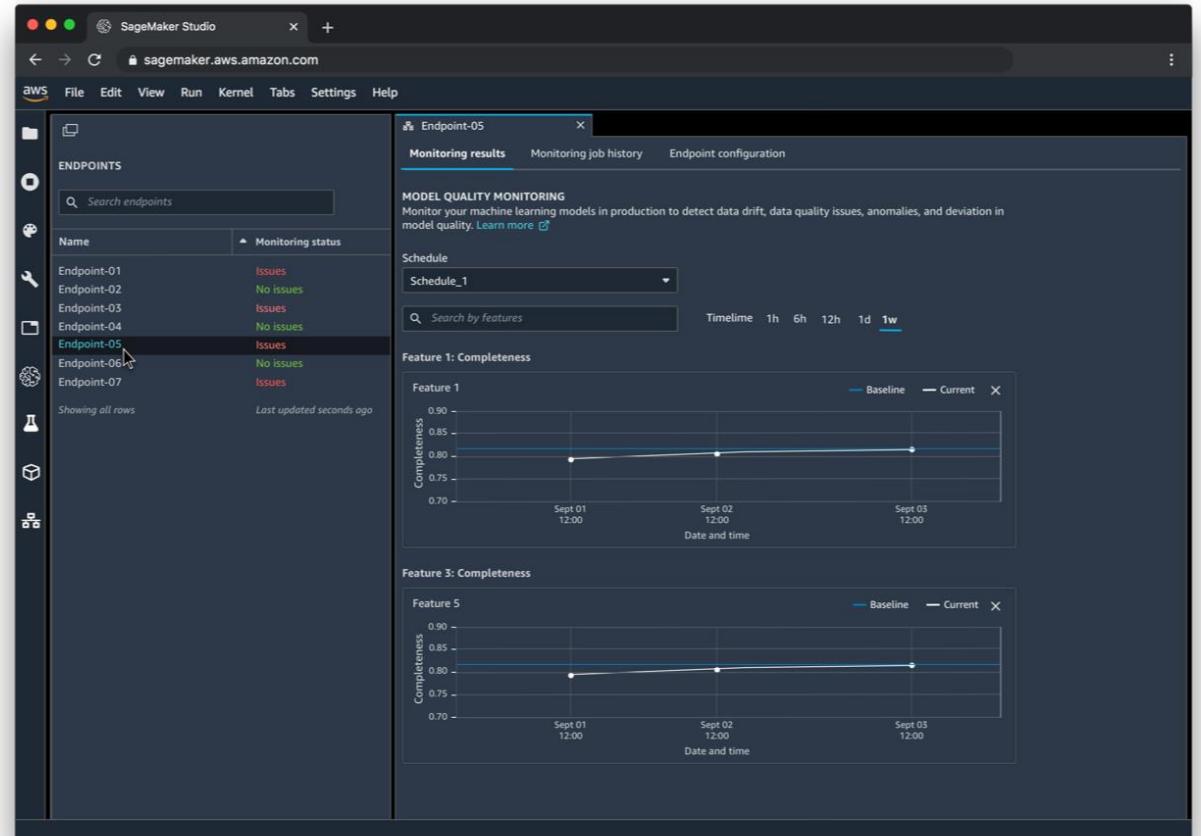

1 Introduction

The ability to correctly interpret a prediction model's output is extremely important. It engenders appropriate user trust, provides insight into how a model may be improved, and supports understanding of the process being modeled. In some applications, simple models (e.g., linear models) are often preferred for their ease of interpretation, even if they may be less accurate than complex ones. However, the growing availability of big data has increased the benefits of using complex models, so bringing to the forefront the trade-off between accuracy and interpretability of a model's output. A wide variety of different methods have been recently proposed to address this issue [5, 8, 9, 3, 4, 1]. But an understanding of how these methods relate and when one method is preferable to another is still lacking.

Here, we present a novel unified approach to interpreting model predictions.¹ Our approach leads to three potentially surprising results that bring clarity to the growing space of methods:

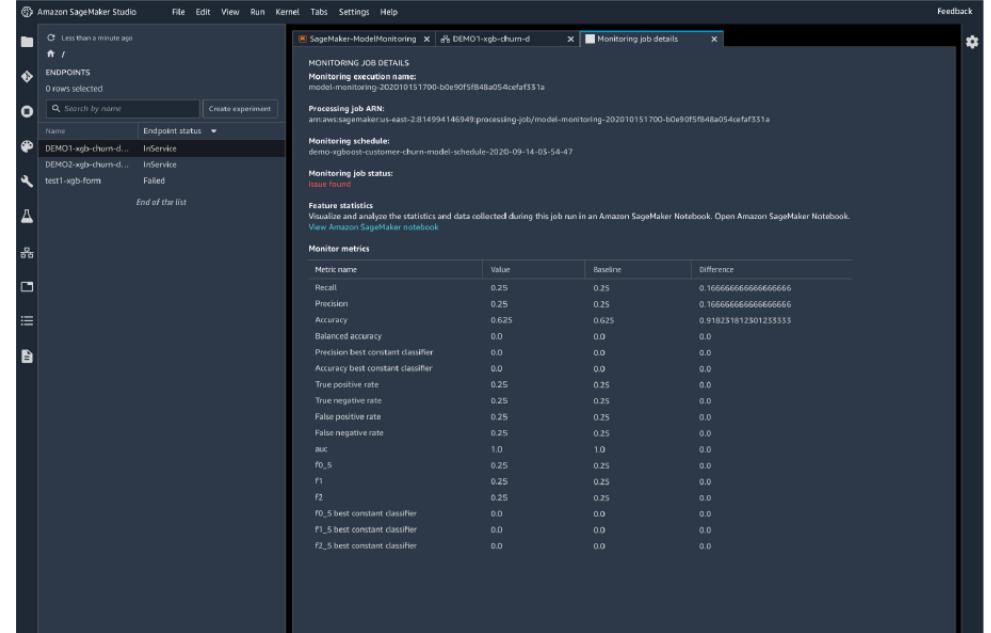

SageMaker Model Monitor

- Get alerts on quality deviations on your deployed models (via CloudWatch)
- Visualize data drift
 - Example: loan model starts giving people more credit due to drifting or missing input features
- Detect anomalies & outliers
- Detect new features
- No code needed

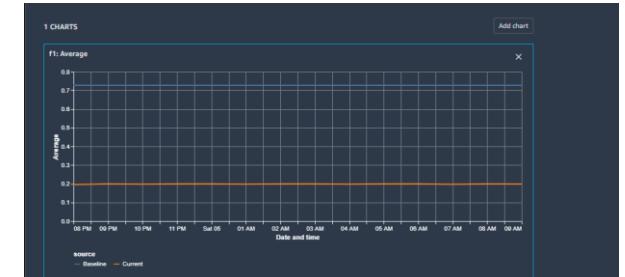

SageMaker Model Monitor + Clarify

- Integrates with SageMaker Clarify
 - SageMaker Clarify detects potential bias
 - i.e., imbalances across different groups / ages / income brackets
 - With ModelMonitor, you can monitor for bias and be alerted to new potential bias via CloudWatch
 - SageMaker Clarify also helps explain model behavior
 - Understand which features contribute the most to your predictions

SageMaker Model Monitor

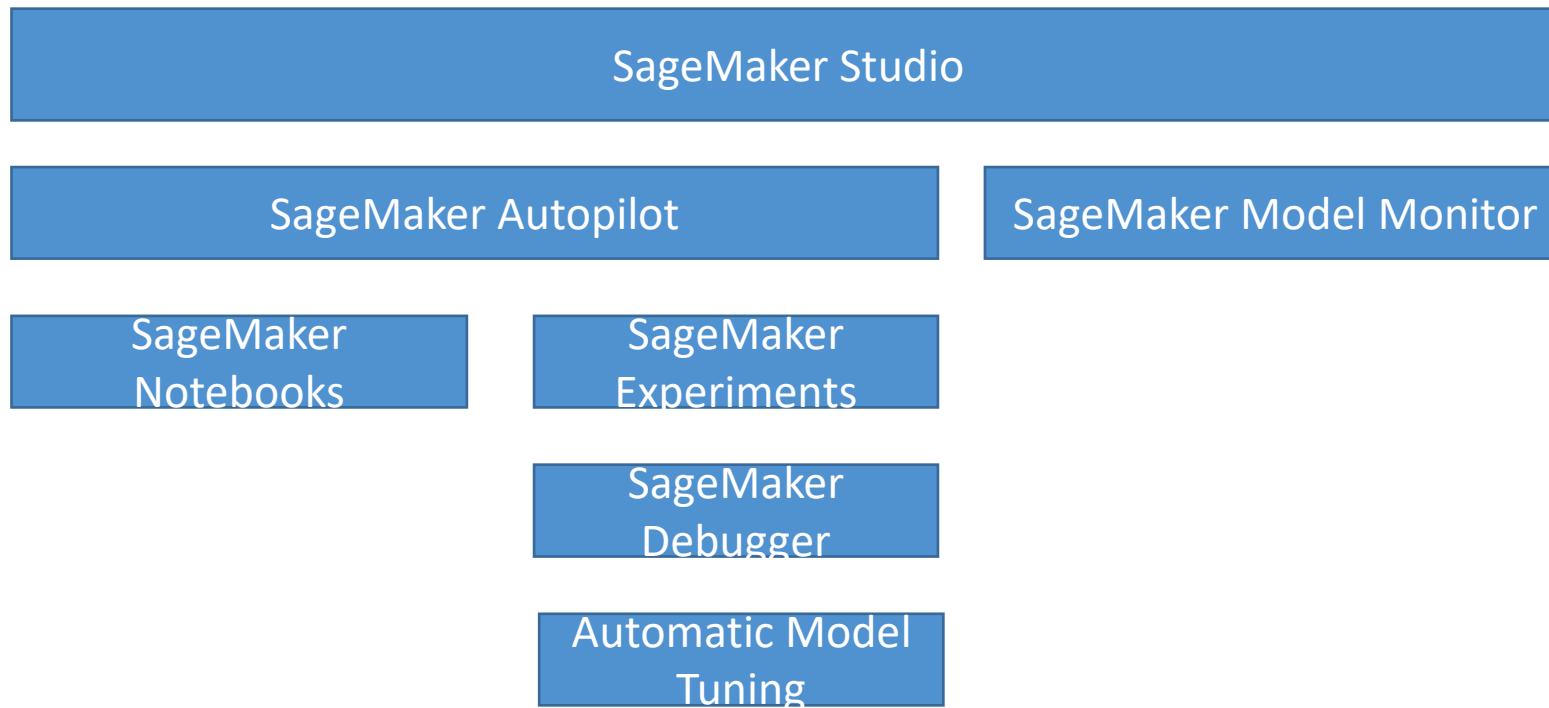

- Data is stored in S3 and secured
- Monitoring jobs are scheduled via a Monitoring Schedule
- Metrics are emitted to CloudWatch
 - CloudWatch notifications can be used to trigger alarms
 - You'd then take corrective action (retrain the model, audit the data)
- Integrates with Tensorboard, QuickSight, Tableau
 - Or just visualize within SageMaker Studio

SageMaker Model Monitor

- Monitoring Types:
 - Drift in data quality
 - Relative to a baseline you create
 - “Quality” is just statistical properties of the features
 - Drift in model quality (accuracy, etc)
 - Works the same way with a model quality baseline
 - Can integrate with Ground Truth labels
 - Bias drift
 - Feature attribution drift
 - Based on Normalized Discounted Cumulative Gain (NDCG) score
 - This compares feature ranking of training vs. live data

Putting them together

SageMaker in 2021

- SageMaker JumpStart
 - One-click models and algorithms from model zoos
 - Over 150 open source models in NLP, object detections, image classification, etc.
- SageMaker Data Wrangler
 - Import / transform / analyze / export data within SageMaker Studio
- SageMaker Feature Store
 - Find, discover, and share features in Studio
 - Online (low latency) or offline (for training or batch inference) modes
 - Features organized into Feature Groups
- SageMaker Edge Manager
 - Software agent for edge devices
 - Model optimized with SageMaker Neo
 - Collects and samples data for monitoring, labeling, retraining

Higher-Level AI/ML Services

Amazon Comprehend

Amazon Comprehend

- Natural Language Processing and Text Analytics
- Input social media, emails, web pages, documents, transcripts, medical records (Comprehend Medical)
- Extract key phrases, entities, sentiment, language, syntax, topics, and document classifications
- Can train on your own data

Entities

Amazon Transcribe

Amazon Transcribe

- Speech to text
 - Input in FLAC, MP3, MP4, or WAV, in a specified language
 - Streaming audio supported (HTTP/2 or WebSocket)
 - French, English, Spanish only
- Speaker Identification
 - Specify number of speakers
- Channel Identification
 - i.e., two callers could be transcribed separately
 - Merging based on timing of “utterances”
- Custom Vocabularies
 - Vocabulary Lists (just a list of special words – names, acronyms)
 - Vocabulary Tables (can include “SoundsLike”, “IPA”, and “DisplayAs”)

Amazon Transcribe

Amazon Transcribe > Real-time transcription

Real-time transcription Info

See how Amazon Transcribe creates a text copy of speech in real time. Choose **Start streaming** and talk.

Amazon Polly

Amazon Polly

- Neural Text-To-Speech, many voices & languages
- Lexicons
 - Customize pronunciation of specific words & phrases
 - Example: “World Wide Web Consortium” instead of “W3C”
- SSML
 - Alternative to plain text
 - Speech Synthesis Markup Language
 - Gives control over emphasis, pronunciation, breathing, whispering, speech rate, pitch, pauses.
- Speech Marks
 - Can encode when sentence / word starts and ends in the audio stream
 - Useful for lip-synching animation

Amazon Polly

Text-to-Speech

Listen, customize, and download speech. Integrate when you're ready.

Type or paste your text in the window, choose your language and region, choose a voice, choose Listen to speech, and then integrate it into your applications and services.

With up to 3000 characters you can listen, download, or save immediately. For up to 100,000 characters, your task must be saved to an S3 bucket.

The screenshot shows the Amazon Polly Text-to-Speech interface. At the top, there are tabs for "Plain text" (selected), "SSML", and a question mark icon. Below the tabs is a text input area containing the text: "Hi! My name is Joanna. I will read any text you type here." A character count of "58 characters used" is shown below the input area. To the right of the input area are buttons for "Show default text" and "Clear text".

Below the input area, there are sections for "Engine" (Standard selected) and "Language and Region" (English, US). To the right, there is a "Voice" section listing various voices:

- Salli, Female
- Joanna, Female (selected)
- Ivy, Female
- Kendra, Female
- Kimberly, Female
- Matthew, Male
- Justin, Male
- Joey, Male

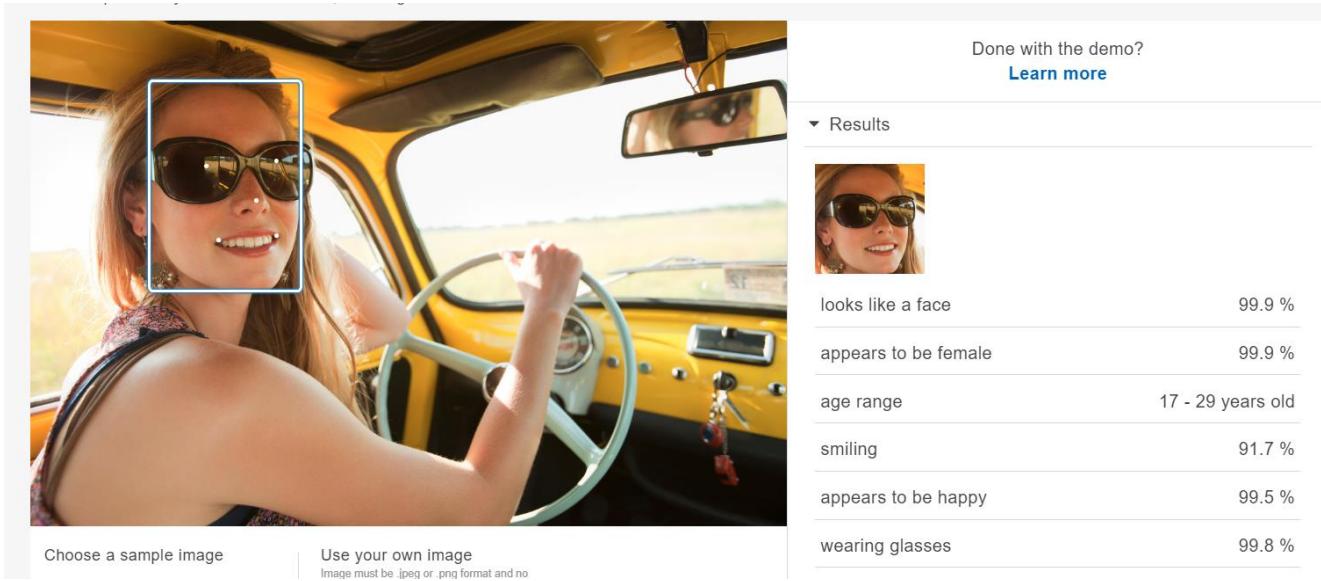

On the far right, there are several buttons: "▶ Listen to speech", "Download MP3", "Change file format", "Synthesize to S3", and "Change S3 task settings".

At the bottom left, there is a section titled "Customize pronunciation" with a note about applying lexicons. It includes a "Learn more" link, an "Apply lexicon" dropdown, and an "Upload lexicon" button.

Rekognition

Rekognition

- Computer vision
- Object and scene detection
 - Can use your own face collection
- Image moderation
- Facial analysis
- Celebrity recognition
- Face comparison
- Text in image
- Video analysis
 - Objects / people / celebrities marked on timeline
 - People Pathing

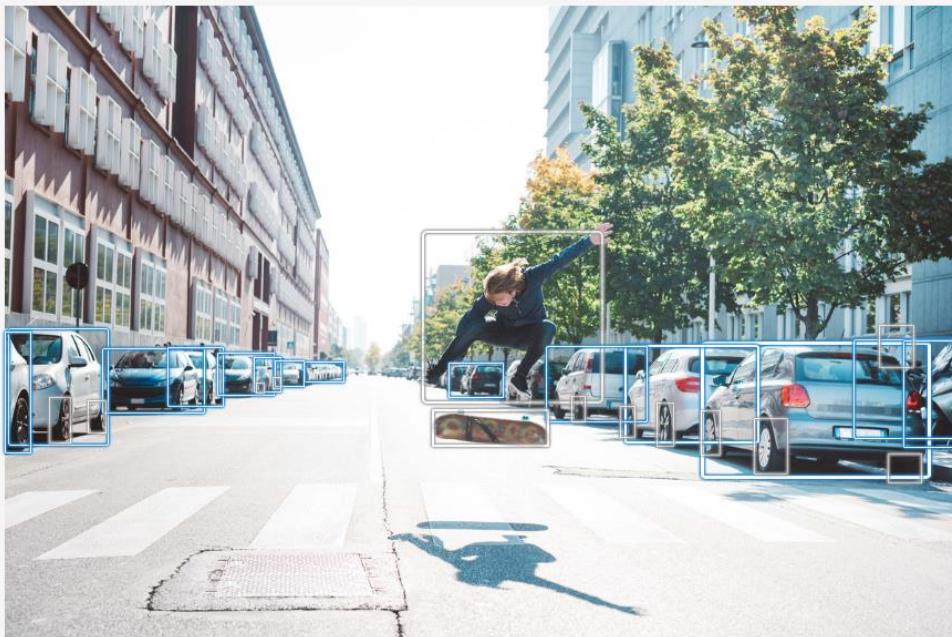

Rekognition: The Nitty Gritty

- Images come from S3, or provide image bytes as part of request
 - S3 will be faster if the image is already there
- Facial recognition depends on good lighting, angle, visibility of eyes, resolution
- Video must come from Kinesis Video Streams
 - H.264 encoded
 - 5-30 FPS
 - Favor resolution over framerate
- Can use with Lambda to trigger image analysis upon upload

Rekognition

Object and scene detection

Rekognition automatically labels objects, concepts and scenes in your images, and provides a confidence score.

Choose a sample image

Use your own image

Image must be .jpeg or .png format and no larger than 5MB. Your image isn't stored.

Request

Response

New in 2020: Rekognition Custom Labels

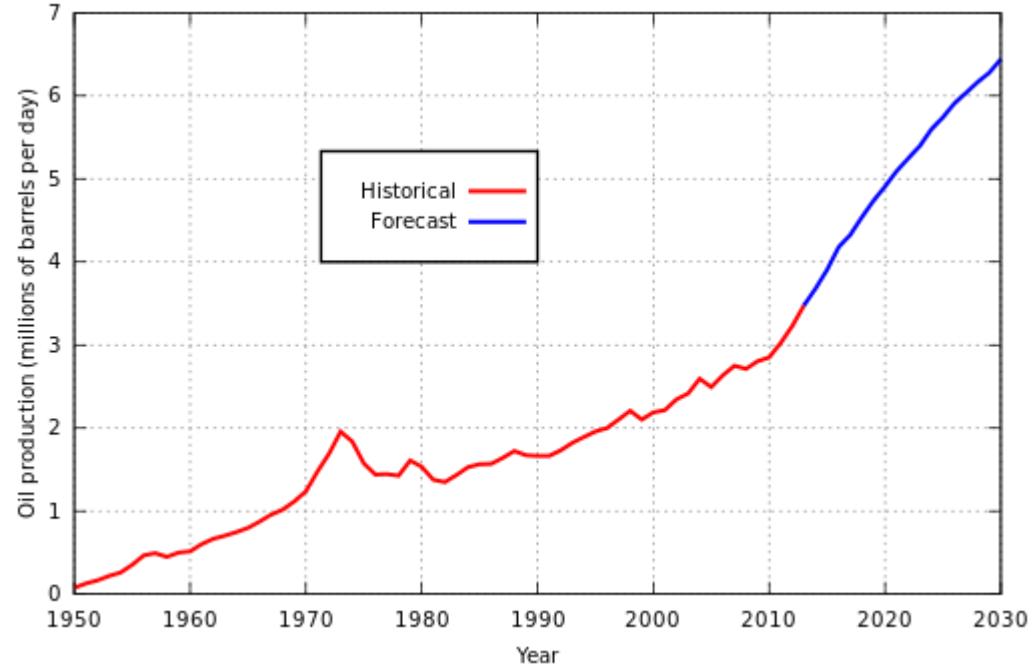

- Train with a small set of labeled images
- Use your own labels for unique items
- Example: the NFL (National Football League in the US) uses custom labels to identify team logos, pylons, and foam fingers in images.

Amazon Forecast

Amazon Forecast

- Fully-managed service to deliver highly accurate forecasts with ML
- “AutoML” chooses best model for your time series data
 - ARIMA, DeepAR, ETS, NPTS, Prophet
- Works with any time series
 - Price, promotions, economic performance, etc.
 - Can combine with associated data to find relationships
- Inventory planning, financial planning, resource planning
- Based on “dataset groups,” “predictors,” and “forecasts.”

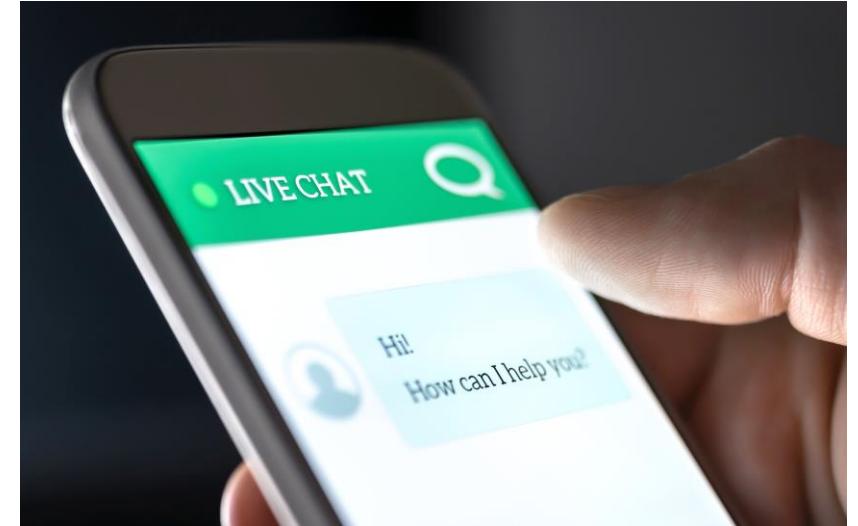

Ain92, using modified code by David "RockyMtnGuy" Moe [CC BY-SA 3.0] (<https://creativecommons.org/licenses/by-sa/3.0/>)

Amazon Lex

Amazon Lex

- Billed as the inner workings of Alexa
- Natural-language chatbot engine
- A Bot is built around Intents
 - Utterances invoke intents (“I want to order a pizza”)
 - Lambda functions are invoked to fulfill the intent
 - Slots specify extra information needed by the intent
 - Pizza size, toppings, crust type, when to deliver, etc.
- Can deploy to AWS Mobile SDK, Facebook Messenger, Slack, and Twilio

Other ML Services

The Best of the Rest

- Amazon Personalize
 - Recommender system
- Amazon Textract
 - OCR with forms, fields, tables support
- AWS DeepRacer
 - Reinforcement learning powered 1/18-scale race car
- DeepLens
 - Deep learning-enabled video camera
 - Integrated with Rekognition, SageMaker, Polly, Tensorflow, MXNet, Caffe

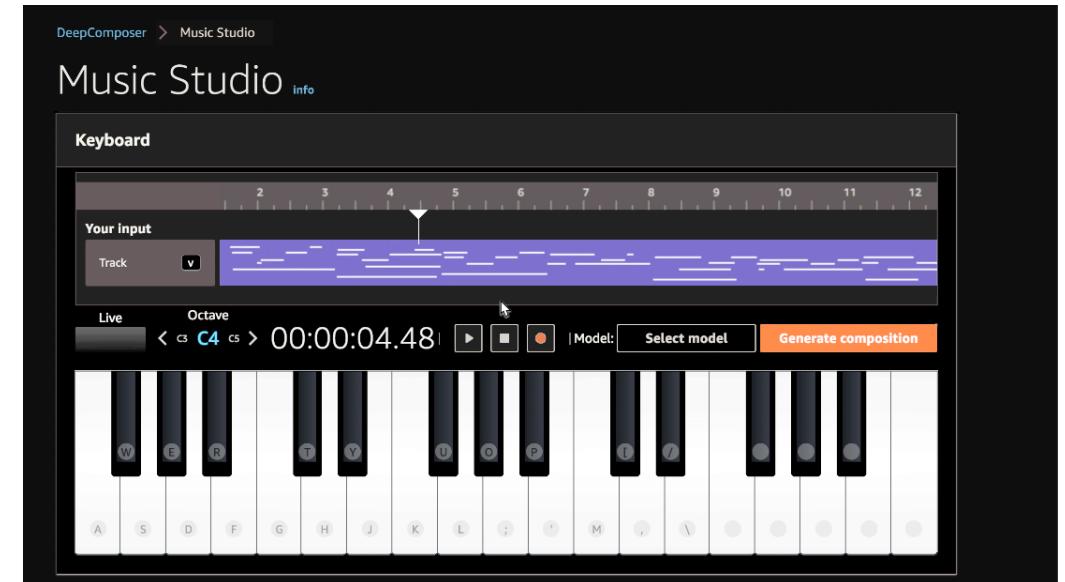

New ML Services

For 2020 and beyond

AWS DeepComposer

- AI-powered keyboard
- Composes a melody into an entire song
- For educational purposes

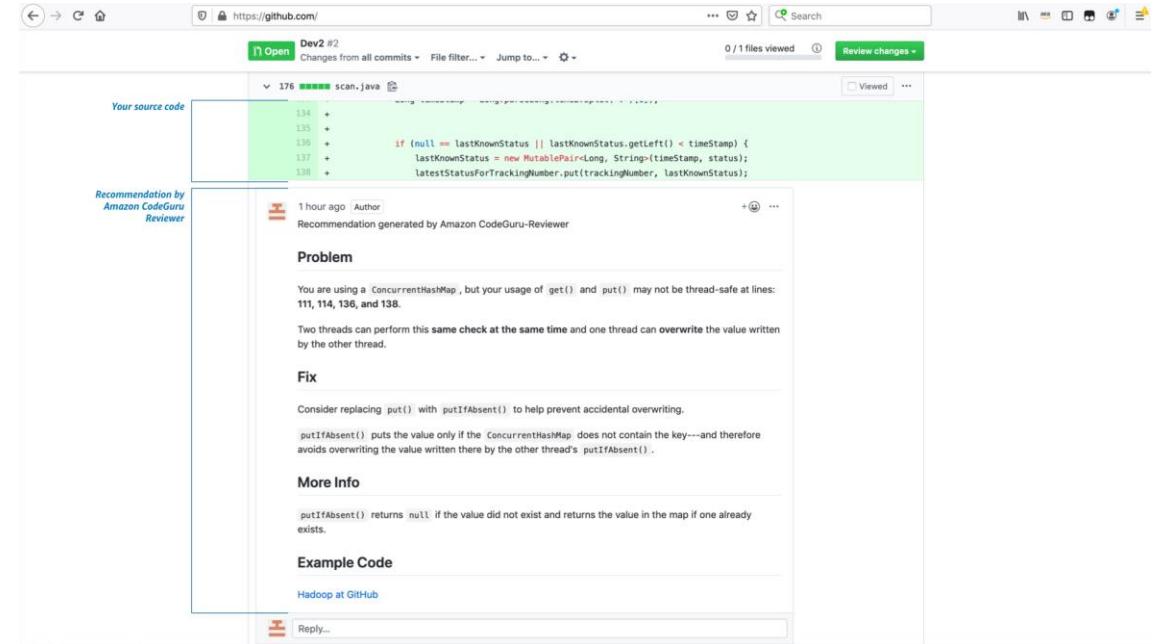

Amazon Fraud Detector

- Upload your own historical fraud data
- Builds custom models from a template you choose
- Exposes an API for your online application
- Assess risk from:
 - New accounts
 - Guest checkout
 - “Try before you buy” abuse
 - Online payments

Amazon CodeGuru

- Automated code reviews!
- Finds lines of code that hurt performance
- Resource leaks, race conditions
- Offers specific recommendations
- Powered by ML
- Currently Java-only (more coming soon)

Contact Lens for Amazon Connect

- For customer support call centers
- Ingests audio data from recorded calls
- Allows search on calls / chats
- Sentiment analysis
- Find “utterances” that correlate with successful calls
- Categorize calls automatically
- Measure talk speed and interruptions
- Theme detection: discovers emerging issues

Amazon Kendra

- Enterprise search with natural language
- For example, “Where is the IT support desk?” “How do I connect to my VPN?”
- Combines data from file systems, SharePoint, intranet, sharing services (JDBC, S3) into one searchable repository
- ML-powered (of course) – uses thumbs up / down feedback
- Relevance tuning – boost strength of document freshness, view counts, etc.
- Alexa’s sister? I don’t know, but that’s one way to remember it ☺

The screenshot shows the Amazon Kendra Intranet Search interface. The search bar at the top contains the query "it support desk". Below the search bar, there are sections for "SEARCH IN:" (Everything (21), Wiki (17), Email List Archive (3)), "REFINE:" (Categories: Service (1), Team (1); Creator: admin (1), abcde (1), it (1), corp (1)), and "RESULTS PAGE". The results page displays 10 of 21 items, with the first item being "IT_Support_Training_Program.Web" and the second being "Com_Support_Wiki.Web". A callout bubble points to the "Com_Support_Wiki.Web" result, which includes a snippet of text about IT help desks and a link to the document. The right side of the interface shows a sidebar with "Kendra's suggested answer" (1st floor), frequently asked questions (Where do I get IT help?, What are the IT support hours?, Where can I get IT help corporate campus?), and a link to "What are frequently asked questions? Info".

Amazon Augmented AI (A2I)

- Human review of ML predictions
- Builds workflows for reviewing low-confidence predictions
- Access the Mechanical Turk workforce or vendors
- Integrated into Amazon Textract and Rekognition
- Integrates with SageMaker
- Very similar to Ground Truth

Putting Them Together

Putting the blocks together

- Build your own Alexa!
 - Transcribe -> Lex -> Polly
- Make a universal translator!
 - Transcribe -> Translate -> Polly
- Build a Jeff Bezos detector!
 - DeepLens -> Rekognition
- Are people on the phone happy?
 - Transcribe -> Comprehend

ML Implementations and Operations

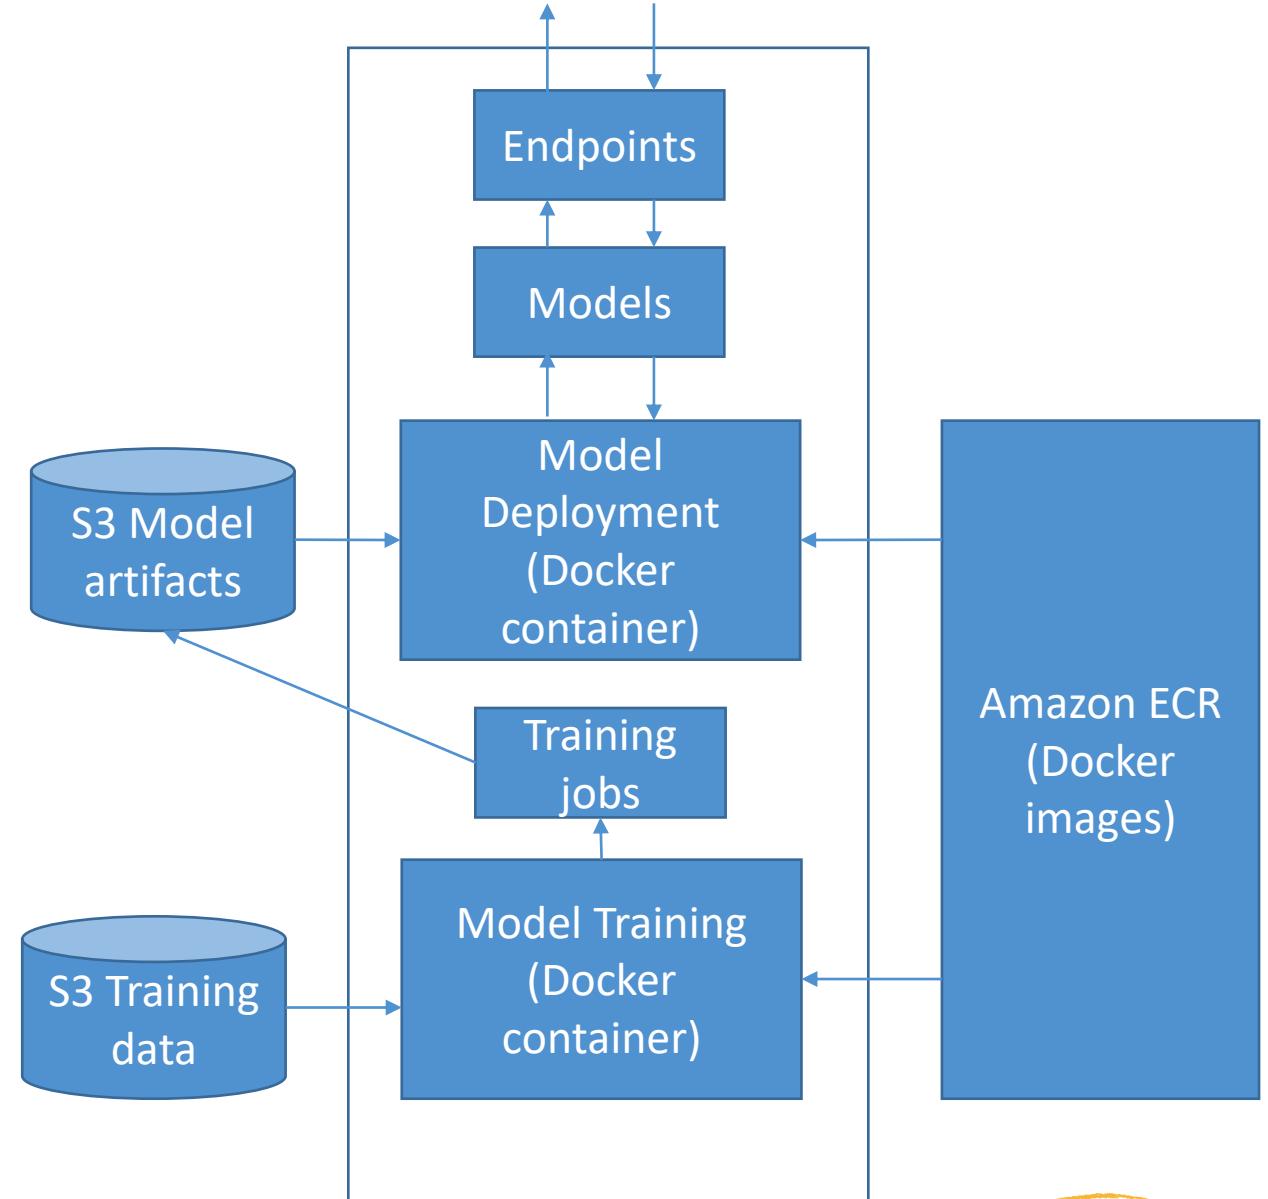

SageMaker and Docker Containers

SageMaker + Docker

- All models in SageMaker are hosted in Docker containers
 - Pre-built deep learning
 - Pre-built scikit-learn and Spark ML
 - Pre-built Tensorflow, MXNet, Chainer, PyTorch
 - Distributed training via Horovod or Parameter Servers
 - Your own training and inference code! Or extend a pre-built image.
- This allows you to use any script or algorithm within SageMaker, regardless of runtime or language
 - Containers are isolated, and contain all dependencies and resources needed to run

Using Docker

- Docker containers are created from *images*
- Images are built from a *Dockerfile*
- Images are saved in a *repository*
 - Amazon Elastic Container Registry

Amazon SageMaker Containers

- Library for making containers compatible with SageMaker
 - RUN pip install sagemaker-containers in your Dockerfile

Structure of a training container

```
/opt/ml
└── input
    ├── config
    │   ├── hyperparameters.json
    │   └── resourceConfig.json
    └── data
        └── <channel_name>
            └── <input data>
└── model
└── code
    └── <script files>
└── output
    └── failure
```

Structure of a Deployment Container

```
/opt/ml  
└ model  
    └ <model files>
```

Structure of your Docker image

- WORKDIR
 - nginx.conf
 - predictor.py
 - serve/
 - train/
 - wsgi.py

Assembling it all in a Dockerfile

```
FROM tensorflow/tensorflow:2.0.0a0

RUN pip install sagemaker-containers

# Copies the training code inside the
# container
COPY train.py /opt/ml/code/train.py

# Defines train.py as script entrypoint
ENV SAGEMAKER_PROGRAM train.py
```

Environment variables

- SAGEMAKER_PROGRAM
 - Run a script inside /opt/ml/code
- SAGEMAKER_TRAINING_MODULE
- SAGEMAKER_SERVICE_MODULE
- SM_MODEL_DIR
- SM_CHANNELS / SM_CHANNEL_*
- SM_HPS / SM_HP_*
- SM_USER_ARGS
- ...and many more

Using your own image

- cd dockerfile
- !docker build -t foo .
- from sagemaker.estimator import Estimator

```
estimator = Estimator(image_name='foo',
                      role='SageMakerRole',
                      train_instance_count=1,
                      train_instance_type='local')
```

```
estimator.fit()
```

Production Variants

- You can test out multiple models on live traffic using Production Variants
 - Variant Weights tell SageMaker how to distribute traffic among them
 - So, you could roll out a new iteration of your model at say 10% variant weight
 - Once you're confident in its performance, ramp it up to 100%
- This lets you do A/B tests, and to validate performance in real-world settings
 - Offline validation isn't always useful

SageMaker on the Edge

SageMaker Neo

- Train once, run anywhere
 - Edge devices
 - ARM, Intel, Nvidia processors
 - Embedded in whatever – your car?
- Optimizes code for specific devices
 - Tensorflow, MXNet, PyTorch, ONNX, XGBoost
- Consists of a **compiler** and a **runtime**

Neo + AWS IoT Greengrass

- Neo-compiled models can be deployed to an HTTPS endpoint
 - Hosted on C5, M5, M4, P3, or P2 instances
 - Must be same instance type used for compilation
- OR! You can deploy to IoT Greengrass
 - This is how you get the model to an actual edge device
 - Inference at the edge with local data, using model trained in the cloud
 - Uses Lambda inference applications

SageMaker Security

General AWS Security

- Use Identity and Access Management (IAM)
 - Set up user accounts with only the permissions they need
- Use MFA
- Use SSL/TLS when connecting to anything
- Use CloudTrail to log API and user activity
- Use encryption
- Be careful with PII

Protecting your Data at Rest in SageMaker

- AWS Key Management Service (KMS)
 - Accepted by notebooks and all SageMaker jobs
 - Training, tuning, batch transform, endpoints
 - Notebooks and everything under /opt/ml/ and /tmp can be encrypted with a KMS key
- S3
 - Can use encrypted S3 buckets for training data and hosting models
 - S3 can also use KMS

Protecting Data in Transit in SageMaker

- All traffic supports TLS / SSL
- IAM roles are assigned to SageMaker to give it permissions to access resources
- Inter-node training communication may be optionally encrypted
 - Can increase training time and cost with deep learning
 - AKA inter-container traffic encryption
 - Enabled via console or API when setting up a training or tuning job

SageMaker + VPC

- Training jobs run in a Virtual Private Cloud (VPC)
- You can use a private VPC for even more security
 - You'll need to set up S3 VPC endpoints
 - Custom endpoint policies and S3 bucket policies can keep this secure
- Notebooks are Internet-enabled by default
 - This can be a security hole
 - **If disabled, your VPC needs an interface endpoint (PrivateLink) or NAT Gateway, and allow outbound connections, for training and hosting to work**
- Training and Inference Containers are also Internet-enabled by default
 - Network isolation is an option, but this also prevents S3 access

SageMaker + IAM

- User permissions for:
 - CreateTrainingJob
 - CreateModel
 - CreateEndpointConfig
 - CreateTransformJob
 - CreateHyperParameterTuningJob
 - CreateNotebookInstance
 - UpdateNotebookInstance
- Predefined policies:
 - AmazonSageMakerReadOnly
 - AmazonSageMakerFullAccess
 - AdministratorAccess
 - DataScientist

SageMaker Logging and Monitoring

- CloudWatch can log, monitor and alarm on:
 - Invocations and latency of endpoints
 - Health of instance nodes (CPU, memory, etc)
 - Ground Truth (active workers, how much they are doing)
- CloudTrail records actions from users, roles, and services within SageMaker
 - Log files delivered to S3 for auditing

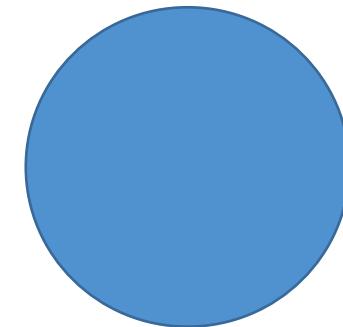

Managing SageMaker Resources

Choosing your instance types

- We covered this under “modeling”, even though it’s an operations concern
- In general, algorithms that rely on deep learning will benefit from GPU instances (P2 or P3) for training
- Inference is usually less demanding and you can often get away with compute instances there (C4, C5)
- GPU instances can be really pricey

Managed Spot Training

- Can use EC2 Spot instances for training
 - Save up to 90% over on-demand instances
- Spot instances can be interrupted!
 - Use checkpoints to S3 so training can resume
- Can increase training time as you need to wait for spot instances to become available

Elastic Inference

- Accelerates deep learning inference
 - At fraction of cost of using a GPU instance for inference
- EI accelerators may be added alongside a CPU instance
 - ml.eia1.medium / large / xlarge
- EI accelerators may also be applied to notebooks
- Works with Tensorflow and MXNet pre-built containers
 - ONNX may be used to export models to MXNet
- Works with custom containers built with EI-enabled Tensorflow or MXNet
- Works with Image Classification and Object Detection built-in algorithms

Automatic Scaling

- You set up a scaling policy to define target metrics, min/max capacity, cooldown periods
- Works with CloudWatch
- Dynamically adjusts number of instances for a production variant
- Load test your configuration before using it!

SageMaker and Availability Zones

- SageMaker automatically attempts to distribute instances across availability zones
- But you need more than one instance for this to work!
- Deploy multiple instances for each production endpoint
- Configure VPC's with at least two subnets, each in a different AZ

Inference Pipelines

Inference Pipelines

- Linear sequence of 2-5 containers
- Any combination of pre-trained built-in algorithms or your own algorithms in Docker containers
- Combine pre-processing, predictions, post-processing
- Spark ML and scikit-learn containers OK
 - Spark ML can be run with Glue or EMR
 - Serialized into MLeap format
- Can handle both real-time inference and batch transforms

More Prep Resources

Practice Exams (including Amazon's)

AWS Certified Machine Learning Specialty Practice Exam

65 questions | 3 hours | 75% correct required to pass

Simulate the real AWS Certified Machine Learning Specialty exam experience. You'll encounter the same number of questions, the same breakdown of topics, and a similar format to the real thing. Your ability to pass or fail this exam should be a good indicator of your readiness for the real thing.

When taking the real exam, some questions might sound similar to some of these practice questions, since they cover the same material. But they are not the same. If you see a question on the real exam that looks familiar, don't automatically select the same answer that you remember from this practice exam. Odds are the question is actually a little different, and has a different answer.

The actual exam is timed and you will have 3 hours, with no breaks, to complete it. You should find that 3 hours is more than sufficient, so take your time and read each question and possible answer carefully.

Instructions:

- You can pause the test at any time and resume later.
- You can retake the test as many times as you would like.
- The progress bar at the top of the screen will show your progress as well as the time remaining in the test.

About this course

Test your readiness for the newest, toughest AWS certification (MLS-C01) with a full-length, realistic practice exam.

SageMaker Developer Guide

<https://docs.aws.amazon.com/sagemaker/latest/dg/>

The screenshot shows the AWS SageMaker Developer Guide homepage. The top navigation bar includes links for AWS Documentation, Amazon SageMaker, Developer Guide, and Sign In to the Console. The main content area features a banner about the new look of the documentation website, a sidebar with a search bar and a list of topics under "What Is Amazon SageMaker?", and a central column with sections on the service's purpose, HIPAA compliance, and tips for first-time users.

You can return to the original look by selecting English in the language selector above.

What Is Amazon SageMaker?

Amazon SageMaker is a fully managed machine learning service. With Amazon SageMaker, data scientists and developers can quickly and easily build and train machine learning models, and then directly deploy them into a production-ready hosted environment. It provides an integrated Jupyter authoring notebook instance for easy access to your data sources for exploration and analysis, so you don't have to manage servers. It also provides common machine learning algorithms that are optimized to run efficiently against extremely large data in a distributed environment. With native support for bring-your-own-algorithms and frameworks, Amazon SageMaker offers flexible distributed training options that adjust to your specific workflows. Deploy a model into a secure and scalable environment by launching it with a single click from the Amazon SageMaker console. Training and hosting are billed by minutes of usage, with no minimum fees and no upfront commitments.

This is a HIPAA Eligible Service. For more information about AWS, U.S. Health Insurance Portability and Accountability Act of 1996 (HIPAA), and using AWS services to process, store, and transmit protected health information (PHI), see [HIPAA Overview](#).

Are You a First-time User of Amazon SageMaker?

If you are a first-time user of Amazon SageMaker, we recommend that you do the following:

1. Read [How Amazon SageMaker Works](#) – This section provides an overview of Amazon SageMaker, explains key concepts, and describes the core components involved in building AI solutions with Amazon SageMaker. We recommend that you read this topic in the order presented.
2. Read [Get Started](#) – This section explains how to set up your account and create your first Amazon SageMaker notebook instance.
3. Try a model training exercise – This exercise walks you through training your first model. You use training algorithms provided by Amazon SageMaker. For more information, see [Get Started](#).
4. Explore other topics – Depending on your needs, do the following:

Amazon's Exam Guide

AWS Certified Machine Learning—Specialty
(MLS-C01) Exam Guide

<https://aws.amazon.com/certification/certified-machine-learning-specialty/>

Introduction

The AWS Certified Machine Learning—Specialty (MLS-C01) exam is intended for individuals who perform a Development or Data Science role. This exam validates an examinee's ability to build, train, tune, and deploy machine learning (ML) models using the AWS Cloud.

It validates an examinee's ability to design, implement, deploy, and maintain ML solutions for given business problems. It will validate the candidate's ability to:

- Select and justify the appropriate ML approach for a given business problem.
- Identify appropriate AWS services to implement ML solutions.
- Design and implement scalable, cost-optimized, reliable, and secure ML solutions.

Recommended AWS Knowledge

The successful candidate likely has one to two years of hands-on experience developing, architecting, or running ML/deep learning workloads on the AWS Cloud, along with:

- The ability to express the intuition behind basic ML algorithms
- Experience performing basic hyperparameter optimization
- Experience with ML and deep learning frameworks
- The ability to follow model-training best practices
- The ability to follow deployment and operational best practices

Exam Preparation

These training courses and materials may be helpful for examination preparation:

AWS Training (aws.amazon.com/training)

- Big Data on AWS: 3-day instructor-led live [course](#)
- Deep Learning on AWS: 1-day instructor-led live [course](#)

Other Materials

- Machine Learning on AWS [web-page](#)
- Amazon Machine Learning Concepts [document](#)
- Splitting Your Data [document](#)
- Types of Machine Learning Models [document](#)
- Data Transformations [document](#)
- Containerized Machine Learning on AWS [video](#)
- AWS re:Invent Machine Learning talk [video](#)

Amazon's Sample Questions

Machine Learning - Specialty (MLS-C01) Sample Exam Questions

- 1) A Machine Learning team has several large CSV datasets in Amazon S3. Historically, models built with the Amazon SageMaker Linear Learner algorithm have taken hours to train on similar-sized datasets. The team's leaders need to accelerate the training process.

What can a Machine Learning Specialist do to address this concern?

- A. Use Amazon SageMaker Pipe mode.
- B. Use Amazon Machine Learning to train the models.
- C. Use Amazon Kinesis to stream the data to Amazon SageMaker.
- D. Use AWS Glue to transform the CSV dataset to the JSON format.

- 2) A term frequency-inverse document frequency (tf-idf) matrix using both unigrams and bigrams is built from a text corpus consisting of the following two sentences:

1. Please call the number below.
2. Please do not call us.

What are the dimensions of the tf-idf matrix?

- A. (2, 16)
- B. (2, 8)
- C. (2, 10)
- D. (8, 10)

- 3) A company is setting up a system to manage all of the datasets it stores in Amazon S3. The company would like to automate running transformation jobs on the data and maintaining a catalog of the metadata concerning the datasets. The solution should require the least amount of setup and maintenance.

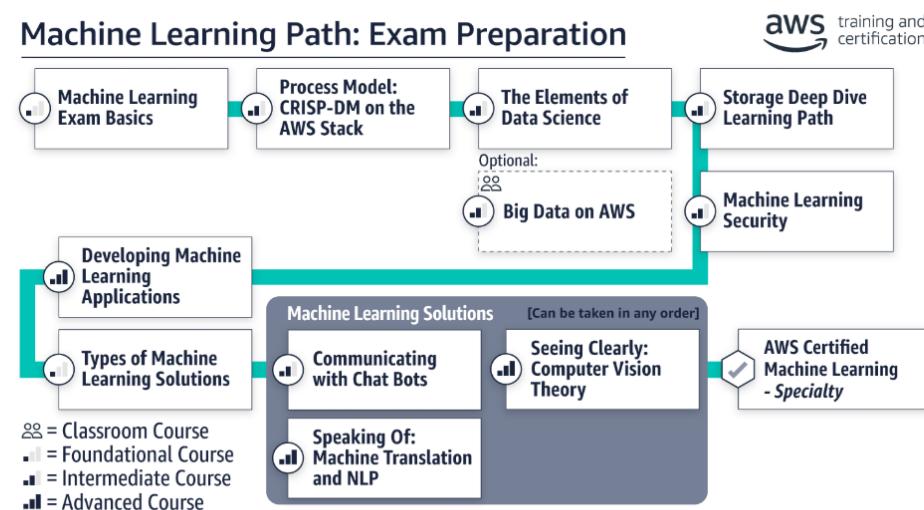

Which solution will allow the company to achieve its goals?

- A. Create an Amazon EMR cluster with Apache Hive installed. Then, create a Hive metastore and a script to run transformation jobs on a schedule.
- B. Create an AWS Glue crawler to populate the AWS Glue Data Catalog. Then, author an AWS Glue ETL job, and set up a schedule for data transformation jobs.
- C. Create an Amazon EMR cluster with Apache Spark installed. Then, create an Apache Hive metastore and a script to run transformation jobs on a schedule.
- D. Create an AWS Data Pipeline that transforms the data. Then, create an Apache Hive metastore and a

Amazon's learning path

- <https://aws.amazon.com/training/learning-paths/machine-learning/exam-preparation/>

This learning path is **designed specifically for individuals preparing to take the AWS Certified Machine Learning – Specialty exam**. In addition to these self-paced digital training courses, we recommend one or more years of hands-on experience using machine learning (ML) services on AWS.

Consider taking the Big Data / Data Analytics Exam first

What to Expect

Sitting for the exam

- 3 hours! (170 minutes technically)
 - But you'll probably only need a little over 2.
 - 65 questions
 - TAKE THE TIME TO FULLY UNDERSTAND THEM
- Use the flag capability
 - You'll have time to go back and double check things.
- You can't bring anything into the room
 - You'll be given note paper or dry-erase board, earplugs, and that's it.
- Schedule smartly
 - As soon as possible after you've mastered the practice exams
 - Choose a time of day that matches your highest energy level – you need stamina
 - Remember different testing providers may have different availability

Prepare

- Use the bathroom before you head in
- Eat something (but not right beforehand)
- Get a good night's sleep
- Review things you need to memorize before going in
 - Recall, Precision, F1
 - Regularization techniques
- Be alert
 - Whatever works for you...
- Make sure you're ready
 - You've got \$300 on the line
 - Take the practice exams! Repeatedly!

Strategies

- Don't rush
 - For each question, take the time to understand:
 - What you are optimizing for
 - Requirements
 - The system as a whole
- Your pace should be about 2 – 2 ½ minutes per question
 - If you're taking longer, make your best guess, flag it and come back to it later
- Use the process of elimination
 - Even if you don't know the correct answer, you can often eliminate several.
- Keep calm
 - You're not going to get 100%. You don't have to.
